Legend. Spike mutations (AA) are represented by the wild-type amino acid (1-letter code) - residue position - and the mutant amino acid. The total number (N) of genomes generated each month, as well as the number (n) and the percentage (%) of each mutation at different time intervals, are shown. More than one mutant residue was observed in eight positions (P25L or P25S, H49Y or H49L, A67S or A67T, W152L or W152C, D215G or D215H, T259I or T259A, Q613H or Q613E, and P681H or P681T or P681R). Four mutations at the furin cleavage site were observed. N679K in 302 genomes, P681H in 209 genomes, P681R and P681T found in one genome each. The spike mutations N679K and P681H showed a sharp increase from 3.4% (N679K) and 1.1% (P681H) in late March to 76.9% (N679K) and 13.5% (P681H) in early July. Together, genomes carrying furin site mutations (N679K or P681H) represent more than 90% of those sequenced in July.
