## Supplemental Methods

### RNA extraction, cDNA synthesis, library preparation and sequencing

Clinical testing was performed using various FDA emergency use authorization (EUA) assays for detection of SARS-CoV-2 RNA, i.e., the Roche Cobas 6800 SARS-CoV-2 (90% of the samples in this study), Cepheid Xpert SARS-CoV-2, or SARS-CoV-2/Flu/RSV assays.

RNA was extracted from 400  $\mu$ l of each nasopharyngeal swab specimens using the MagMAX™ Viral/Pathogen Nucleic Acid Isolation Kit on the KingFisher flex system (Thermo Fisher Scientific). Eleven  $\mu$ l of RNA were used for first strand cDNA synthesis using the Superscript IV first-strand synthesis kit (Invitrogen, ref# 180901050). Libraries were prepared using Swift Normalase Amplicon SARS-CoV-2 Panel (SNAP) and SARS-CoV-2 additional Genome Coverage Panel (Cat# SN-5X296 core kit, 96rxn), using 10  $\mu$ l of first strand cDNA, with 24 PCR cycles<sup>1</sup>. Libraries were pooled and run on the Illumina NovaSeq 6000 system on SP 300 cycle flow cells, as paired-end 150 cycles with dual indexing reads. Typically, two pools representing two full 96 well plates (192 samples) were sequenced on each SP300 NovaSeq flow cell. Reads were demultiplexed using the Illumina bcl2fastq2 Conversion Software v2.20, and adapters and low-quality bases were trimmed with Trimmomatic v0.36<sup>2</sup>. BWA v0.7.17<sup>3</sup> was utilized for mapping reads to the SARS-CoV-2 reference genome (NC\_045512.2, wuhCor1). SNAP tiled primer sequences were removed with Primerclip v0.3.8<sup>4</sup>. BCFtools v1.9<sup>5</sup> was used to call mutations and assemble consensus sequences, which were then assigned phylogenetic lineage designations according to PANGO nomenclature, version 2021-09-28<sup>6</sup>.

### Phylogenetic and mutation analyses

SARS-CoV-2 full genome sequences were aligned using Mafft v.7<sup>7</sup>. The alignment was cropped to base pairs 202-29,666 according to the Wuhan-Hu-1 reference to remove N- and C-terminal regions with unassigned base pairs. Maximum likelihood IQ trees were performed using the IQ-TREE XSEDE tool, multicore version 2.1.2, on the Cipres Science gateway v.3.3<sup>8</sup>. GTR+F+I+G4 was chosen as the best-fit substitution model according to the Bayesian Information Criterion (BIC) as determined by Modelfinder<sup>8</sup>. Support values were generated with 1000 bootstrap replicates and the ultrafast bootstrapping method, and the oldest SARS-CoV-2 sequence (Wuhan/WH01/EPI\_ISL\_406798/2019-12-26) was set as the root of the tree. The tree was constructed using 132 vaccine breakthrough and 283 unvaccinated control SARS-CoV-2 sequences from our NYU cohort (greater NYC area) together with 920 US reference sequences (non-NYU) and 2176 global reference sequences (non-US) for a total of 3511 SARS-CoV-2 genomic sequences. The reference sequences were retrieved from a North America-focused Nextstrain build with global subsampling<sup>9,10</sup>. Phylogenetic trees were visualized in Interactive Tree Of Life (iTOL) v.6<sup>11</sup>.

Mutations compared to Wuhan-Hu-1 as reference were determined on MAFFT-aligned SARS-CoV-2 sequences in program R v.4.1.0<sup>12</sup> and R Studio v.1.4.1106<sup>13</sup> using scripts based on the seqinr and tidyverse packages. The statistical analyses considered residues that were covered by sequencing, i.e., non-ambiguous characters and gaps, whereas ambiguous and undefined characters were excluded. Fisher exact tests and multiplicity corrections (Benjamini-Hochberg)<sup>14</sup> were done in Program R. Multiplicity corrected P values (q) <0.05 were considered significant.

## Visualization

Mutation data tables, line charts, mirror bar graphs, and lollipop plots were created in Microsoft Excel 2016 and/or program R (ggplot2 package). Individual spike mutations of MAFFT-aligned SARS-CoV-2 vaccine breakthrough sequences in comparison to Wuhan-Hu-1 as master were visualized using the Highlighter tool provided by the Los Alamos HIV sequence database<sup>15</sup>, focusing on the translated spike region and unambiguously defined amino acids and gaps. Circular edge bundling plots were generated in undirected mode in R using ggraph, igraph, tidyverse, and RColorBrewer packages. Edges are only shown if  $P < 0.05$ , and nodes are sized according to the connecting edges'  $r$  values. Nodes are color-coded according to groups of variables. Stacked bar graphs and bubble plots were created using the ggplot2 package in R; box plots were made in Prism. Donut plots were created in Excel and stream graphs using RAWGraphs v.2.0<sup>16</sup>. Structural analyses were performed using Chimera v.1.15rc<sup>17</sup> and the structural models of SARS-CoV-2 spike with human ACE2, pdb S\_ ACE2<sup>18</sup> and SARS-CoV-2 polymerase RdRp (nsp12) in complex with nsp7, nsp8, template-primer RNA, and Remdesivir triphosphate, pdb 7bv2<sup>19</sup>.

## Statistical analysis

The comparison of 132 breakthrough and 283 unvaccinated control samples achieved 96% power in detecting a 15% difference (10% versus 25%) of a study variable, e.g., genotype or mutation rate, in a two-tailed chi squared/Fisher Exact test with an error of 5% (G\*Power v.3.1.9.4)<sup>20</sup>. We evaluated the variant distribution in fully vaccinated compared to unvaccinated individuals, as follows. To address confounding and other sources of bias arising from the use of observational data, we performed matching and adjustment in R. We estimated a propensity score for the likelihood of full vaccination, and matched vaccinated to unvaccinated patients 1:1, including clinical collection date, age, and sex as covariates<sup>21</sup>. Propensity-score matching was implemented using the nearest neighbor strategy with the MatchIt algorithm in program R<sup>22</sup>. Matched analyses were primarily done for the accumulated data set from the moment when breakthrough cases were recorded in our cohort, i.e., in February 2021, by aggregating data from our previous (76 breakthrough and 1046 control sequences)<sup>23</sup> and current study for a total of 208 breakthrough and 1329 control sequences. Quality controls of matching included the analysis of propensity score distributions and empirical quantile-quantile (eQQ) plots of distribution balance of covariates using the MatchIt package in program R. All breakthrough cases were successfully matched, reducing the standardized mean difference between the matched patients from 0.95 to 0.01. Before and after matching, we evaluated the presence of Alpha (B.1.1.7), Delta (B.1.617.2 or AY.\*; \* can be any number), Gamma (P.1), Iota (B.1.526), and all other variants. To compare the probability of a Delta variant for the vaccinated and unvaccinated groups over time (by study month), we performed logistic regression analyses on the full data (208 versus 1329 sequences) adjusting for sex, age (centered and standardized), and month of test. Linear regression analysis of variant distribution over time since vaccination was done in Prism v.8.4.3 using two-sided Pearson tests. Statistical comparisons of clinical and demographic variables between groups were made using non-parametric Mann-Whitney tests or Kruskal-Wallis tests with Dunn's multiplicity correction in Prism. Correlation analyses were done using two-sided Spearman rank tests in Prism and  $P < 0.05$  was considered significant.

## External data sources

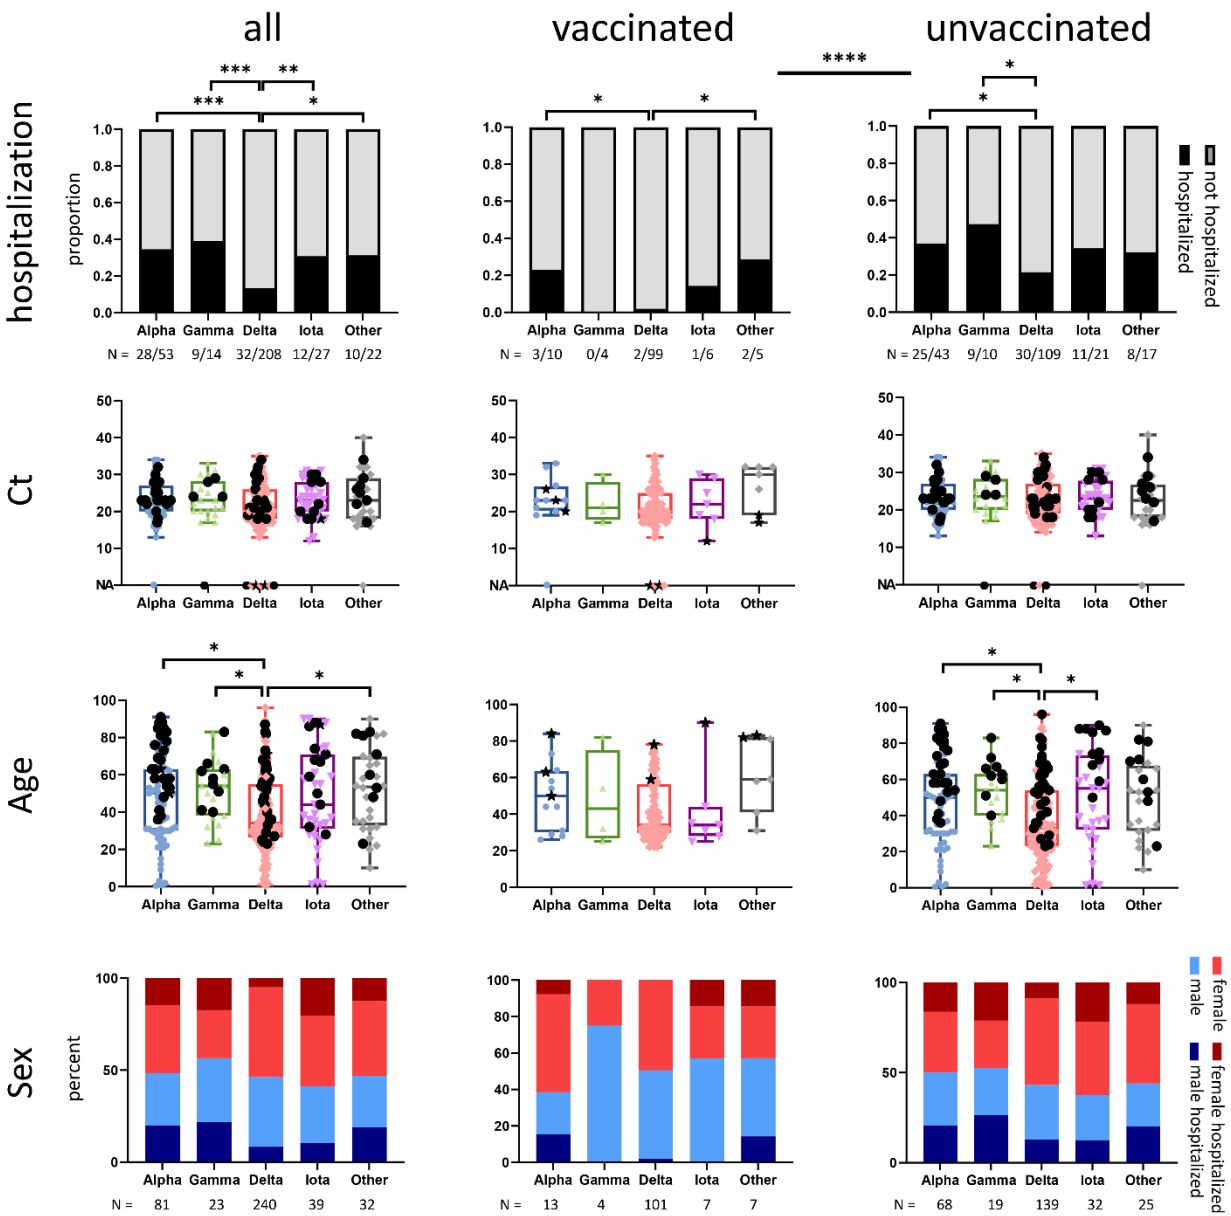

New York City-wide, daily COVID-19 case numbers and hospitalizations were obtained from NYC Open Data with data provided by the Department of Health and Mental Hygiene (DOHMH)<sup>24</sup> and NYC Health with data provided by the Citywide Immunization Registry (CIR)<sup>25</sup>.

## Supplemental Figures

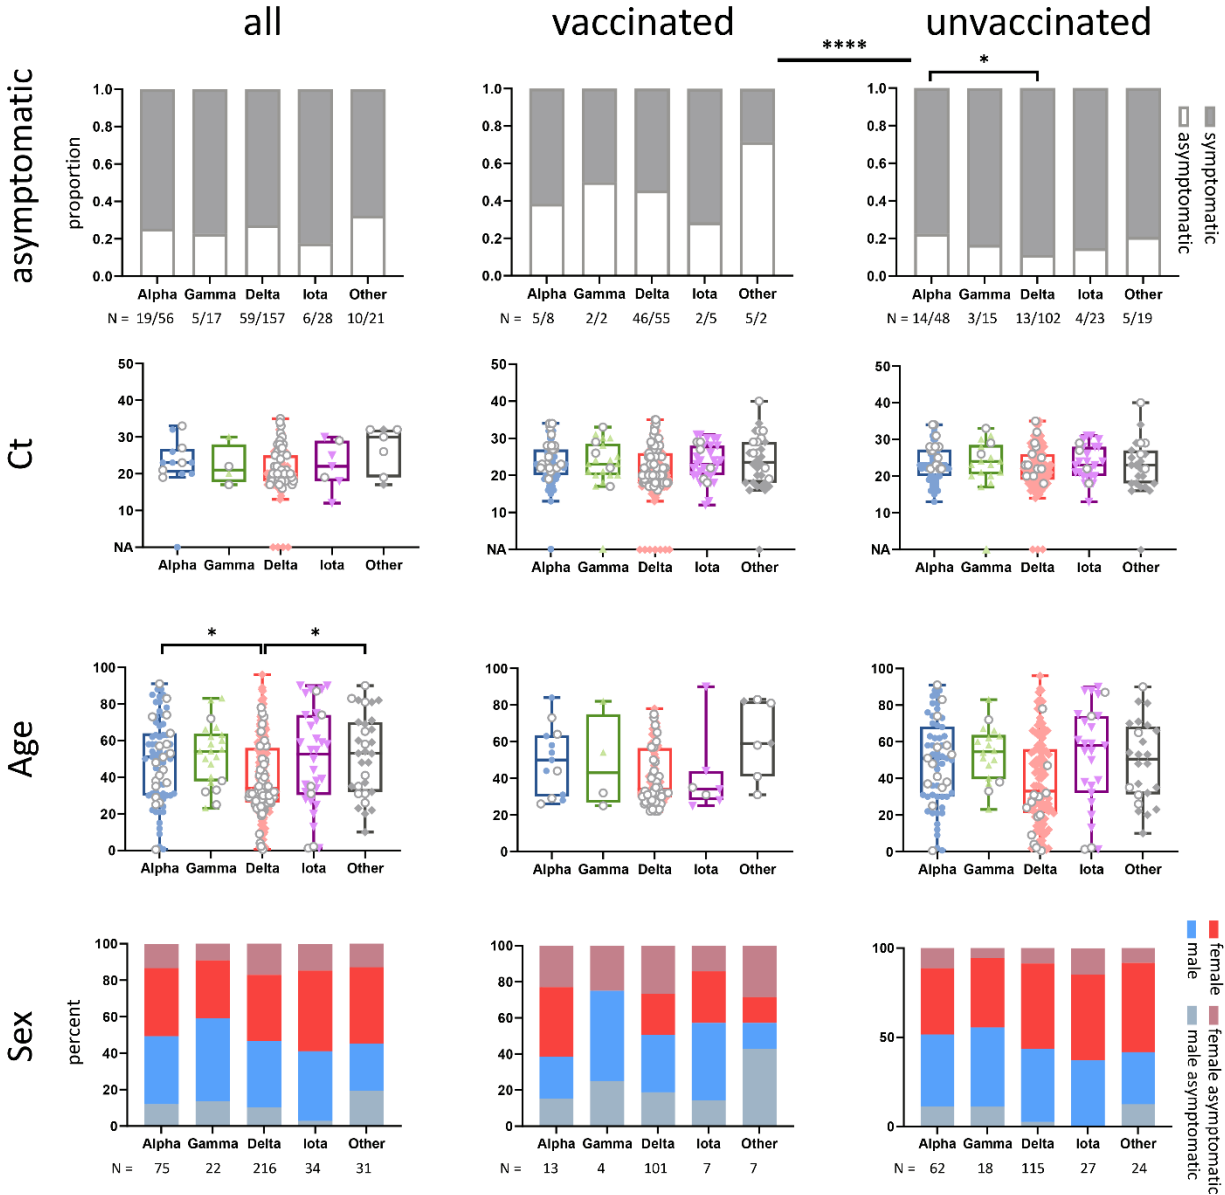

**Figure S1. Hospitalizations and demographic data by variant in breakthrough cases and unvaccinated controls.**

Bar graphs and box plots summarizing hospitalizations and different demographic variables by variant. Top row: hospitalization rates were compared using Fisher exact tests. Numbers (N) indicate hospitalizations versus non-hospitalized cases per variant. Middle two rows: hospitalized cases are shown in black circles (unvaccinated) or stars (vaccinated). Whiskers indicate the range, boxes the interquartile range, and horizontal line the median of values. Statistical analysis was done using Kruskal-Wallis test. Bottom row: sex distribution per variant where darker colors

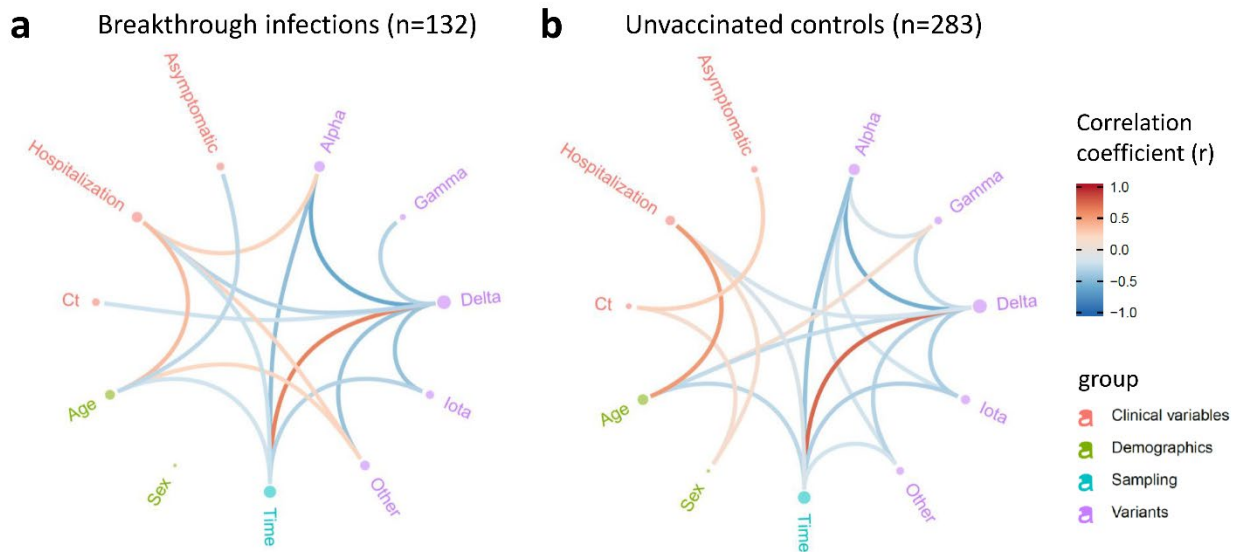

indicate hospitalizations. Total case numbers per variant are listed below (N). \* P<0.05, \*\* P<0.01, \*\*\* P<0.005. Ct: Cycle threshold in RT-PCR; NA: not available.

**Figure S2. Asymptomatic infections and demographic data by variant in breakthrough cases and unvaccinated controls.**

Bar graphs and box plots summarizing asymptomatic/symptomatic data and different demographic variables by variant. Top row: asymptomatic rates were compared using Fisher exact tests. Numbers (N) indicate asymptomatic versus symptomatic cases per variant. Middle two rows: asymptomatic cases are shown in gray circles with white fill. Whiskers indicate the range, boxes the interquartile range, and horizontal line the median of values. Statistical analysis was done using Kruskal-Wallis test. Bottom row: sex distribution per variant where red-gray and

blue-gray colors indicate asymptomatic cases. Total case numbers per variant are listed below (N). \*  $P < 0.05$ , \*\*  $P < 0.01$ , \*\*\*  $P < 0.005$ . Ct: Cycle threshold in RT-PCR; NA: not available.

**Figure S3. Relationship of clinical, demographic, and genomic data in breakthrough cases and unvaccinated controls.**

Correlation analysis of clinical, demographic, and genomic data, shown separately for the 132 vaccinated (**a**) and 283 unvaccinated (**b**) SARS-CoV-2-positive individuals. Red and blue edges represent positive and negative correlations between connected variables, respectively, according to the scale of  $r$  values to the right. Only significant correlations ( $P < 0.05$ , Spearman rank test) are displayed. Nodes are color-coded based on the grouping of variables. Node size corresponds to the strength of correlations. Ct: Cycle threshold in RT-PCR; sex: male sex; time: date of sampling.

## Delta subtree

### Figure S4. Phylogenetic analysis of SARS-CoV-2 Delta sequences.

Maximum likelihood (IQ) tree of 943 SARS-CoV-2 full genome sequences (base pairs 202-29,666 according to Wuhan-Hu-1 as reference), including 101 vaccine breakthrough (orange) and 139 unvaccinated control SARS-CoV-2 sequences from the NYU Langone Health cohort (greater NYC area) (purple) together with 700 other US (non-NYU; cyan) and global (non-US; black) Delta reference sequences and three Wuhan sequences from the beginning of the pandemic. The substitution scale of the tree, generated with 1000 bootstrap replicates and Wuhan/WH01/2019-12-26 as root, is indicated at the bottom right. Selected bootstrap values  $\geq 85$  of major branches are indicated. Sequences belonging to the Delta subvariant AY.25 are labeled.

**Figure S5. Spike mutation patterns in vaccine breakthrough sequences.** Highlighter plot showing spike amino acid mutations of 132 SARS-CoV-2 vaccine breakthrough sequences compared to the Wuhan-Hu-1 reference sequence as master (top line). Mutations are shown as ticks, color-coded according to the legend at the bottom. Frequently occurring key mutations are indicated by triangles and labeled. The presence of S112L and hospitalization of study participants are indicated by brown and black symbols, respectively. Study sequences are sorted according to time of sampling, between May 1<sup>st</sup> and August 3<sup>rd</sup>, 2021. Iota (B.1.526), Alpha (B.1.1.7), Gamma (P.1), Delta (B.1.617.2 and AY.\*), and Delta subvariant AY.25 sequences are highlighted and their range of occurrences indicated.

**Figure S6. Site-specific spike mutation analysis in SARS-CoV-2 Delta vaccine breakthrough sequences compared to Delta infections in unvaccinated controls.**

**a**, Comparison of site-specific amino acid mutation (mut) frequencies in spike in the subset of 101 Delta vaccine breakthrough sequences compared to 139 Delta unvaccinated controls from the same cohort. The Wuhan-Hu-1 sequence served as reference to call mutations per site, and all spike mutation sites of the study sequences are shown along the x-axis according to their spike position (n=72). The mirror plot displays differences of mutation frequencies per spike residue between vaccinated and unvaccinated groups; red bars (facing up) refer to higher mutation rates in vaccinated, whereas black bars (facing down) refer to higher mutation rates in unvaccinated controls. Mutations that are 100% conserved in both groups and thus have 0% difference are indicated by a zero on the x-axis. **b**, Enrichment of spike mutations in SARS-CoV-2 Delta vaccine breakthrough sequences. All sites with greater spike mutation rates in vaccinated compared to unvaccinated Delta infections are shown; sites with unique occurrences of mutations in Delta breakthrough cases were disregarded. Mutation sites in the spike N-terminal domain (NTD) and receptor binding domain (RBD) are highlighted. The dashed black line indicates the average mutation frequency across all spike residues in the Delta unvaccinated control data set compared to Wuhan-Hu-1 as reference (n=139).

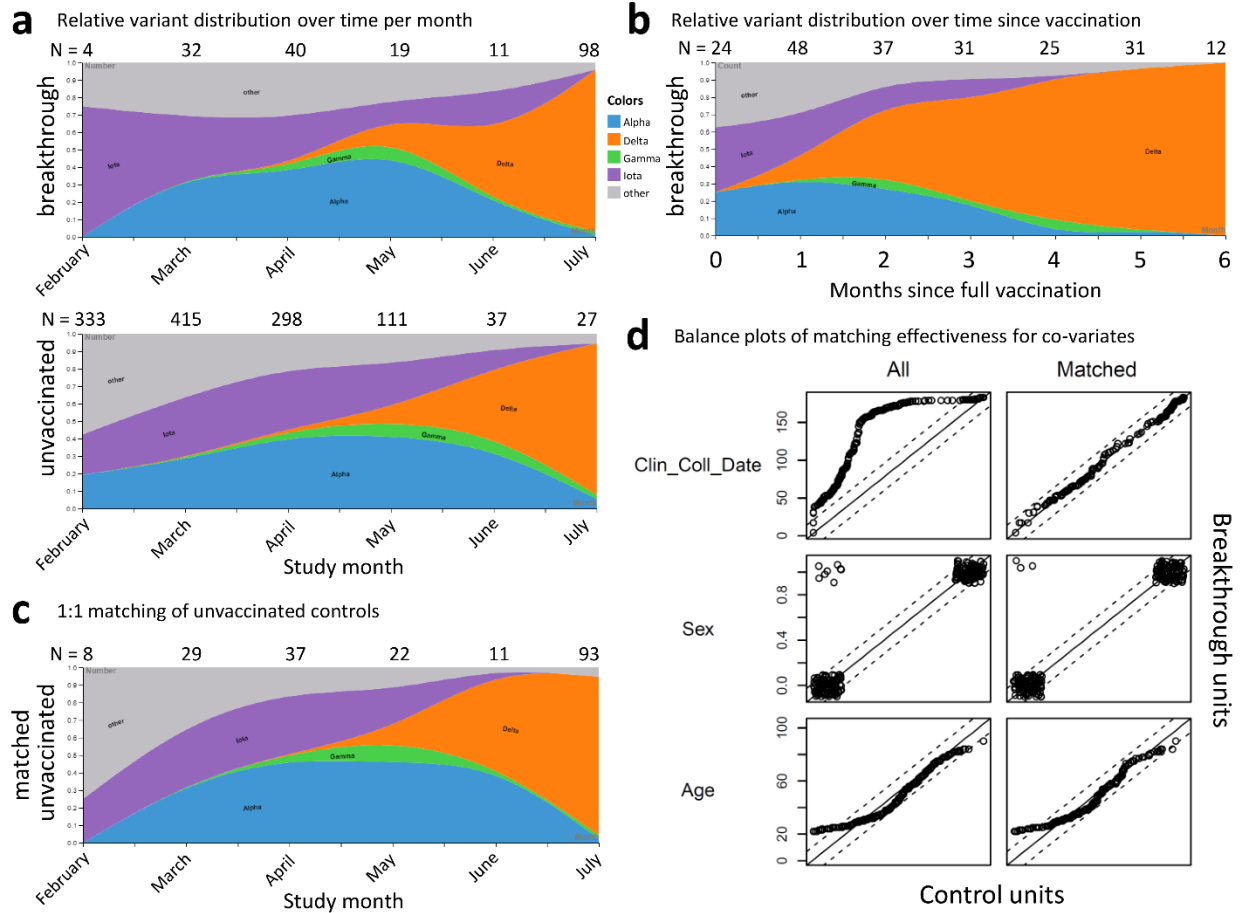

**Figure S7. Ratios of breakthrough SARS-CoV-2 infections by variant and time post vaccination.** Linear regression analysis of breakthrough infection rates per variant against time post vaccination. Significant results are highlighted by asterisks and labeled with the goodness of fit ( $R^2$ ) and P values. Fitted lines with 95% confidence intervals are shown. \*  $P < 0.05$ , \*\*  $P < 0.01$ , \*\*\*  $P < 0.005$ .

**Figure S8. Breakthrough SARS-CoV-2 infections by variant, time post vaccination, and clinical status.**

Box plots summarizing SARS-CoV-2 diagnosis in days post full vaccination (vacc) by variant. Whiskers indicate the range, boxes the interquartile range, and horizontal line the median of values. Symptomatic cases are shown as colored symbols, hospitalized cases as black stars, and asymptomatic cases as gray circles with white fill. \*\*  $P < 0.01$  (Kruskal-Wallis test).

**e** Distribution of propensity scores after matching of all breakthrough and unvaccinated control cases.

**Figure S9. SARS-CoV-2 variant distribution in vaccine breakthrough and unvaccinated cases and quality control of matching.**

**a**, Streamgraphs of relative variant distribution over time (study months). Accumulated case numbers per month are shown on top; August was omitted because of low case numbers (<5).

**b**, Streamgraphs of relative variant distribution over time since vaccination, starting at day 14 after the last dose for full vaccination. Accumulated case numbers per thirty-day periods (months) are shown on top. **c**, Streamgraphs of relative variant distribution over time (study months) in unvaccinated controls after 1:1 matching of each breakthrough case to one unvaccinated control patient. **d**, Empirical quantile-quantile (eQQ) plots to study covariate distribution before (left) and after (right) matching. **e**, Distribution of propensity scores after matching of 208 breakthrough and 1329 unvaccinated control cases, for which we obtained full genome SARS-CoV-2 sequences between February and August 2021.
