

Appendix Methods

Sequencing

Clinical samples from SARS-CoV-2 RT-PCR tested positive case-patients (Ct value <30) were subjected to next generation sequencing. RNA samples were sent to a WHO reference laboratory at the University of Hong Kong for full genome analyses (IRB number: UW 20-168). We deduced near full-length genomes from the samples using a Illumina sequencing protocol previously described by us (1,2). Briefly, virus genome was reverse transcribed with multiple gene-specific primers targeting different regions of the viral genome. The synthesized cDNA was then subjected to multiple overlapping 2-kb PCRs for full-genome amplification. PCR amplicons obtained from the same specimen were pooled and sequenced using Novaseq or iSeq sequencing platform (Illumina). Specifically, for the sample from case-patient 1 with putative recombinant virus, we additionally performed NGS sequencing with the Illumina COVIDSeq kit (<https://www.illumina.com/products/by-type/ivd-products/covidseq.html>) for cross-validation. Generated sequencing reads were quality-trimmed by fastp (<https://github.com/OpenGene/fastp>) and mapped to a reference virus genome (Genbank accession: MN908947.3) by BWA-MEM2 v2.1 (3). Potential PCR duplicates were identified and removed by samtools markdup (<https://www.htslib.org/doc/samtools-markdup.html>). The genome consensus was generated by iVar with the PCR primer trimming protocol (minimum sequence depth of 5 for iSeq samples and minimum sequence depth of 10 for Novaseq samples, and minimum Q value of 30) (4). The deduced sequences can be available GISAID (Accession IDs: https://github.com/Leo-Poon-Lab/BA1_BA2_recombinant_HK/blob/main/GISAID_acccessions.txt). We also cloned a ~2.2 kbp RT-PCR amplicon spanning the putative breakpoint region using Patient 2's sample. The 5' and 3' end of this clone was subjected to standard Sanger sequencing.

Identification of putative recombinants

We scanned all the sequenced samples from imported cases in Hong Kong after November 15, 2021 for putative BA.1/BA.2 recombinants. The lineage defining mutations for BA.1 and BA.2 were curated from Cov-lineages (<https://github.com/cov-lineages/pango-designation/issues/361>) and CoVariants (<https://covariants.org>). For defining a sequence as a putative BA.1/BA.2 recombinant, it must have at least three BA.1- and BA.2- defining mutations, each with an allele frequency >90%. The statistics of sample's read depth, allele frequency and minor allele frequency were deduced from aligned reads in bam files using pysamstats (<https://github.com/alimanfoo/pysamstats>).

Identification of putative parental sequences of the recombinant

The available public BA.1 and BA.2 sequences from GISAID and Genbank (accessed on 2022-03-07, totalling 1,222,642 and 767,399 entries, respectively) were downloaded and mapped to the reference sequence (Genbank accession: MN908947.3) using minimap2 (<https://github.com/lh3/minimap2>). The aligned sequences were used as the database for searching putative parental sequences. The leading/tailing partial sequences (positions 1 to 22005 and 21618 to 29903) of the recombinant genome were extracted by masking the remainder of the genome with “N”s. Masking was also performed for the aligned public sequences with letter “?” using figleaf (https://github.com/Koohoko/figleaf_fasta). The closest matches of the two partial recombinant sequences were separately identified from the above aligned public sequences using gofasta (<https://github.com/virus-evolution/gofasta>).

Phylogenetic analysis

The consensus sequences deduced from NGS data were aligned to the reference genome (GenBank: MN908947.3) using MAFFT-add (<https://mafft.cbrc.jp/alignment/server/add.html>). The representative sequences from SARS-CoV-2 variants of concern Alpha, Beta, Gamma, Delta and Omicron BA.3 were also included. The 5' and 3' untranslated regions were masked before tree building. The Maximum likelihood phylogenies were estimated using IQ-TREE (v.2.1.3) (5), employing the best-fit nucleotide substitution models searched by the software with Wuhan-Hu-1 (GenBank: MN908947.3) as the outgroup. Branch supports are accessed by SH-aLRT and the ultrafast bootstrap, a node is considered supported if SH-aLRT \geq 80% and UFboot \geq 95% (<http://www.iqtree.org/doc/Frequently-Asked-Questions>).

Simplot analysis

The putative BA.1/BA.2 recombinant virus sequence was analysed in Simplot v3.5.1 (6) for the recombination signals. Its similarity plot was plotted against a smaller group of representative variant of concerns (VOCs) including Alpha, Beta, Gamma, Delta, Omicron BA.1, Omicron BA.2, as well as the prototype Wuhan/WH01/2019 (Genbank accession: MN908947.3). Due to the relatively large proportion of strictly conserved sites, these sites were excluded from the alignment before subjecting to the similarity plot analysis. The BA.1/BA.2 recombinant, its putative parents from Omicron BA.1 and BA.2, and prototype Wuhan/WH01/2019 (as outgroup) were analysed for their informative sites of recombination.

The Genbank/GISAID accession numbers of viral sequences used in the Simplot analysis are as follow:

- Alpha: OL807059, OU272361, OU052790, OU179605, OL315388, OU208527, OU174622, OU208088, MW933836, MZ280980, MZ296197, MZ077208, OU022681
- Beta: OU202380, OU516338, OU136527, OK433425, OM765676, OL779105, OU114765, MW963525, OU233168
- Gamma: MW913237, OL803729, MZ414874, MZ217960, MZ536412, OV921949, MZ211976, OM485550, MZ037589
- Delta: OK208965, OK258803, MZ988451, OK101403, OK243904, MZ764878, OK160402, OK054978, MZ888548, MZ888540, MZ888535, MZ888534, OU338538, EPI_ISL_8880068
- BA.1: EPI_ISL_10273412
- BA.2: EPI_ISL_10462716

Code availability

Detailed analysing scripts used in the study can be accessed in a GitHub repository (https://github.com/Leo-Poon-Lab/BA1_BA2_recombinant_HK/blob/main/GISAID_acccessions.txt).

Appendix Figure 1. Importation of SARS-CoV-2 variants from incoming travellers. Dates of these patients first RT-PCR tested positive for SARS-CoV-2 and their countries of origin are as shown. All infections were confirmed by full-genome sequencing.

Appendix Figure 2. Phylogeny of SARS-CoV-2 variants identified in incoming travelers. The Maximum likelihood phylogenetic tree was generated using IQ-TREE employing the GTR+F+I nucleotide substitution model with Wuhan-Hu-1 (GenBank: MN908947.3) as the outgroup. Viral genomes generated from this study (blue) and references sequences used in the analysis are shown as indicated. The recombinant virus detected from Patients 1 and 2 is highlighted by an arrow. The red node points show strongly supported branches by SH-aLRT/ultrafast bootstrap. Scale bar indicates estimated genetic distance.

Appendix Figure 3. Simplot analysis of BA.1/BA.2 recombinant. Full viral genomes of different variant of concerns including Alpha, Beta, Gamma, Delta, Omicron BA.1, Omicron BA.2, as well as the prototype Wuhan/WH01/2019 were used in the analysis.
