Supplemental table 2. Description of each of 5 cognitive tests administered to UK Biobank participants.

Cognitive test	Description
Pairs Memory test	Participants are asked to memorize the position of as many matching pairs of cards as possible. The cards are then turned face down on the screen and the participant is asked to touch as many pairs as possible in the fewest tries. Multiple rounds were conducted. The first round used 3 pairs of cards and the second 6 pairs of cards. The result of the test is the total number of incorrect matches.
Reaction Time test	Based on 12 rounds of the card-game 'Snap'. In each round, the participant is shown two cards at a time; if both cards are the same, they press a button-box that is on the table in front of them as quickly as possible. The result of the test is the mean time it took to first click the 'snap' button across all 12 rounds.
Numeric Memory test	This test designed to assess numeric short-term memory, as part of the touchscreen questionnaire. The participant was shown a 2-digit number to remember. The number then disappeared and after a short while they were asked to enter the number onto the screen. The number became one digit longer each time they remembered correctly (up to a maximum of 12 digits). The result of the test is the number of items remembered correctly.
Prospective Memory test	Early in the touchscreen cognitive section, the participant is shown the message "At the end of the games we will show you four colored shapes and ask you to touch the Blue Square. However, to test your memory, we want you to actually touch the Orange Circle instead." The result of this test is whether the task was completed correctly.
Fluid Intelligence test	This test evaluates the capacity to solve problems that require logic and reasoning ability, independent of acquired knowledge. The participant has 2 minutes to complete as many questions as possible from the test. The result of this test is the number of questions answered correctly.
