Polygenic score analysis. Polygenic scores (PGS) constructed from a GWAS for ADHD in EUR samples from sets of (clumped) SNPs reaching varying P-value thresholds in the GWAS. Effect sizes (beta), standard errors (se) and significance (p) are indicated, along with the proportion of the trait variance explained by the PGS (R2); for the meta-analysis of the study centers, significance of tests of heterogeneity (p_het) are given in lieu of R2.
