unlabeled

Supplemental Digital Content Table 2: LCModel spectral fit output of a single representative GM and WM voxel for selected metabolites from the first (5 min) and last (60 min) time point after D-glucose ingestion, respectively. Respective spectra and LCModel fits are shown in Supplemental Digital Content Figure 2.

Supplemental Digital Content Figure 1: Time courses of axial glutamate+glutamine (Glx₄) maps from all subjects over the entire measurement visualizing the image intensity decrease over time due to deuterium labeling.

Supplemental Digital Content Figure 2: Sample spectra (black) and LCModel fit (red) from a single gray matter (GM) and white matter (WM) voxel of one representative volunteer at the beginning (5 min) and the end (65 min) of the MRSI scan. Spectra were first-order corrected for illustration purposes. Relevant metabolites are total creatine (tCr), glutamate+glutamine (Glx) and total N-acetylaspartate (tNAA). Spectral concentration fits of these particular voxels are shown in Supplemental Digital Content Table 1.

Supplemental Digital Content Figure 3: Time courses of axial glucose (Glc₆) maps from all subjects over the entire measurement visualizing the image intensity decrease over time due to deuterium labeling. No quality criteria threshold was applied for Glc₆ data.
