## Study Oversight.

Dr. Hazan and Dr. Haspel conceived the study. All the authors contributed to the study design. Data were extracted by Hillel Alapi. Dr. Hazan, Dr. Duek, and Gabriel Chodick oversaw the data gathering. All authors contributed to the data analysis. Dr. Hazan and Dr. Haspel wrote the initial manuscript. All authors vouch for the data and analysis. All authors participated in the editing and critical review of the manuscript and decided to submit it for publication. The study was approved by the MHS Ethical Committee.

### Background on COVID-19 vaccinations in Israel.

In December 2020, Israel launched a national immunization campaign against COVID-19 consisting almost exclusively of the Pfizer BNT162b2 vaccine series delivered in two doses 3-4 weeks apart (**Figure S1**). In July and September 2021, the Israeli Ministry of Health initiated third (first booster) and fourth (second booster) dose campaigns, respectively. Vaccines and COVID-19 testing were provided free of charge to all citizens. While at-home antigen tests were available, the Israeli Ministry of Health required a documented positive test prior to quarantine and a negative test after quarantine before issuing a certificate of recovery to patients (https://corona.health.gov.il/en/confirmed-cases-and-patients/cases-recovered/). Thus, censoring of COVID-19 infection is unlikely in our cohort as there was strong incentive to obtain a laboratory diagnosis even if initial testing occurred at home.

Among 1,624,601 MHS participants over 12 years of age 1,594,180 (98.13%) received the Pfizer BNT162b2 vaccine, 29,253 (1.8%) received the Moderna mRNA-1273 vaccine, 437 (0.03%) received the Astra Zeneca ChAdOx1-S product, 400 (0.02%) received Sputnik V, 232 (0.01%) received the Jansen Jcovden vaccine, 46 (0.003%) received the Sinovac CoronaVac product, and for 53 patients (0.003%) the vaccine identify was unspecified.

### Selection of variables for Cox multivariate regression.

We conducted multivariate cox regression model based on clinical relevance and univariate comparison. As a starting point, we included variables who known to be associated with vaccine effectiveness based on previous publications<sup>1-3</sup>. Then, we interrogated violation of Cox assumptions for the variables of interest by computing a Schoenfeld global test (see "Cox model sensitivity analysis" in the Supplementary Appendix below). Variables that were associated with outcomes measured (breakthrough COVID-19 infection or COVID-19-related emergency room visit) with a p<0.1 in the univariate comparison were included in the multivariate model. For the multivariate analysis we used goodness of fit parameters (AIC – Akaike Information Criterion = -2 Log likelihood+ 2p) with a backward elimination approach.

### Cox model sensitivity analysis.

Typically, a Schoenfeld's global test is used to validate the assumption of Cox proportional hazards. However, the large sample sizes of our study present a challenge to this approach since this leads to over-powering<sup>4</sup>. We found evidence of this in our data by applying the Schoenfeld's global test on stratified data with smaller sample sizes (Table S3), demonstrating reduction in test significance compared to the complete dataset. Therefore we used two alternate approaches to orthogonally validate results from our Cox model as recommended<sup>4</sup>: multivariate logistic regression (Table S4) and bootstrap multivariate analysis (Table S5). For logistic regression, we applied the same multivariate Cox regression model, with the exception that follow-up time was not included. The reason for this modification was our goal with logistic regression was to validate the trend rather than the effect size estimated by the Cox model, and that follow-up times were not materially different between vaccination groups (Table 1). For bootstrap analysis, we sampled the entire cohort with 2,000 iterations with replacement calculating hazard ratios and confidence intervals for the same multivariate regression model. Results from both approaches showed similar trends as our multiple Cox regression model, supporting this approach for analyzing the data. As additional support, a plot of scaled Schoenfeld residuals for the variable time-of-vaccination demonstrated stable proportional hazard ratios across the study period (Fig. S3)<sup>5</sup>.

eFigure 1. COVID-19 vaccination schedule in the MHS cohort. Bars represent the number of vaccines given between 8:00-11:59 (AM dosing, red bars) and 16:00-19:59 (PM dosing, black bars). Calendar months are depicted numerically with 1 representing January and 12 representing December. Spikes in infection rates within the Israeli population caused by the delta and omicron SARS-CoV-2 variants as reported by the Israeli Ministry of Health (MOH) are indicated by black and blue horizontal bars, respectively. Panels A-D show vaccine doses over time for the first (A), second (B), first booster (third dose, C), and second booster doses (fourth dose, D).

## eFigure 2

**eFigure 2. Distribution of COVID-19 positivity across the day as a function of COVID-19 vaccine timing. Panel A and B** show the distribution of total COVID tests (**A**) and positivity rates (**B**) across the day for patients receiving the initial COVID-19 vaccine series (doses 1 and 2). AM, patients immunized between 8:00-11:59 (red symbols). PM, patients immunized between 16:00-19:59 (blue symbols). For sample sizes and tabular presentation of these data see **eTable 18**.

# eFigure 3

**eFigure 3. Plot of scaled Schoenfeld residuals for vaccination timing over the study period.** Dashed lines, 95% CI. For discussion of Cox proportional hazards assumption, see "Covid Model Sensitivity Analysis" in the Supplemental Appendix.

**eTable 1: Outcome variable definitions.** Note, we report all outcome variables extracted for this project regardless of whether they entered into the analysis reported by this manuscript.

Variable	Values	Definitions	Timing
Documented SARS-CoV-2 Infection	0/1	A PCR confirmed infection.	The date and time-of-day of a specimen collection that was found to be positive in a PCR test.  If the PCR test was done after the beginning of a hospitalization flagged as a COVID-19 hospitalization, the infection date was set to the beginning of the hospitalization.
Documented SARS-CoV-2 Infection		A PCR: Cycle threshold number.	
Asymptomatic SARS-CoV-2 Infection	0/1	A PCR-confirmed infection with no report of symptoms during referral and during initial physician questioning.	The date set for the SARS-CoV-2 infection outcome.
COVID-19 (symptomatic SARS-CoV-2 Infection)	0/1	A PCR-confirmed infection with report of symptoms during the PCR referral / during the follow-up in the community setting / COVID-19 related hospitalization / COVID-19 related death.  Existing symptoms were considered when the physician or nurse checked the "symptomatic" option in the EMR, or when the following specific symptoms were recorded: fever or chills, cough, shortness of breath or difficulty breathing, sore throat, headache, weakness, congestion or runny nose, myalgia, nausea or vomiting, diarrhea, abdominal pain, loss of taste or smell, inability to eat or drink.	The date set for the SARS-CoV-2 infection outcome.

COVID-19 related emergency room visit	0/1		Date and time-of- day
COVID-19 related hospitalization	0/1	A hospitalization that was reported to the Israeli Ministry of Health (MOH) as a hospitalization of a SARS-CoV-2 infected individual.	The start date of the hospitalization.
COVID-19 related severe state	0/1	As defined by the hospitalizing institution per the Israeli MOH guidelines, consistent with the NIH criteria for severe illness or critical illness: Individuals who have oxygen saturation (SpO2) <94% on room air at sea level, a ratio ofarterial partial pressure of oxygen to fraction of inspired oxygen (PaO2/FiO2) <300 mm Hg, respiratory frequency >30 breaths/min, or lung infiltrates >50%.  Critical Illness: Individuals who have respiratory failure, septic shock, and/or multiple organ dysfunction.	The first date during the hospitalization in which the individual was flagged as being in a severe or critical state.
COVID-19 related death	0/1	A death of a SARS-CoV-2 infected individual reported to the Israeli MOH.	The reported date of death.
COVID-19 vaccine-related side effect	0/1		
SARS-CoV-2-IgG serology post COVID-19 vaccine	0/1	Level of SARS-CoV-2-IgG	Date of the test and time-of-day

eTable 2: Clinical covariate definitions.

Variable	Values	Definitions	Timing
Age		Age in complete years	Current
Sex	Male/Female	As defined in files	Current
COVID Vaccine		Dose number, type	Date for each dose
COVID Vaccine			Time-of-day for each dose
Health-care worker	0/1	Is patient a health-care worker per File.	Current
Long-term care facility resident	0/1	Is patient a long-term care facility resident per file.	Current
