**eFigure 1. Definition of patients with AID or exposed to immunosuppressants prior to COVID-19 diagnosis. A.** COVID-19 patients were dichotomized based on whether or not they were diagnosed with AID Prior to their COVID-19 diagnosis date. **B.** COVID-19 patients were dichotomized based on whether or not they were exposed to immunosuppressants drugs prior to COVID-19 diagnosis date. **C.** Cohort created for vaccinated and antiviral treatment individuals between 12/23/2021 to 06/30/2022.

**eFigure 2:** Statistical models evaluated in COVID-19 patients within N3C to evaluate associations of preexisting AID and/or exposure to IS with COVID-19 severity outcomes. Severity outcomes are defined as hospitalization (Yes/No) or life-threatening disease (Yes/No). Demographic covariables include one each for age, BMI, gender, race, ethnicity, smoking status. Preexisting comorbidities include myocardial infarction (MI), congestive heart failure (CHF), peripheral vascular disease (PVD), stroke, dementia, pulmonary diseases, liver disease (mild and severe), type-2 diabetes mellitus, kidney disease, cancer (metastatic and non-metastatic), and human immunodeficiency virus (HIV). AID represents patients diagnosed with a preexisting AID only, IS represents patients with a preexisting exposure to IS only, and AID/IS represents patients with a preexisting AID diagnosis and exposure to IS.

**Models adjusted for demographics and preexisting comorbidities (Table 2 & eTable3)**

Severity ~ AID + IS + AID/IS + demographic + preexisting comorbidities

**Association between TNF inhibitors and COVID-19 severity outcomes in AID patients (Table3)**

Severity ~ TNF inhibitors + other IS\* + demographic + preexisting comorbidities

- all other IS individually as defined in methods

**Models adjusted for demographics and preexisting comorbidities and stratified by race and gender (eTable4 & eTable5)**

Severity ~ AID + IS + AID/IS + demographic + preexisting comorbidities

**Models adjusted for demographics, preexisting comorbidities, and COVID-19 prevention/intervention (eTable6)**

Severity ~ AID + IS + selected antiviral treatment + vaccination status + demographic + preexisting comorbidities

**eFigure3: Severity outcome distribution by AID and immunosuppressant exposures.** Percentage of COVID-19 patients with or without life-threatening disease and with or without hospitalization for the top 20 AIDs (A, C) and top 15 immunosuppressants (B, D). Patients are considered having a life-threatening disease if they are classified as "Dead" or "Severe".
