

## Supplementary Material

SUMMIT-FA: A new resource for improved transcriptome  
imputation using functional annotations

<b>Phenotypes Analyzed by SUMMIT-FA</b>		
Asthma	Hypertension	Schizophrenia
Coronary Artery Disease	Hyperparathyroidism	Systemic Lupus Erythematosus
Diastolic Pressure	Irritable Bowel Disease	Systolic Pressure
Deep Vein Thrombosis	Insomnia	Type-I Diabetes
Eosinophil Count	Lymphocyte Count	Type-II Diabetes
Eczema	Monocyte Count	Triglycerides
Gout	Psoriasis	Ulcerative Colitis
High Cholesterol	Rheumatoid Arthritis	Waist Circumference

Table 1: **24 phenotypes used in TWAS analysis.**

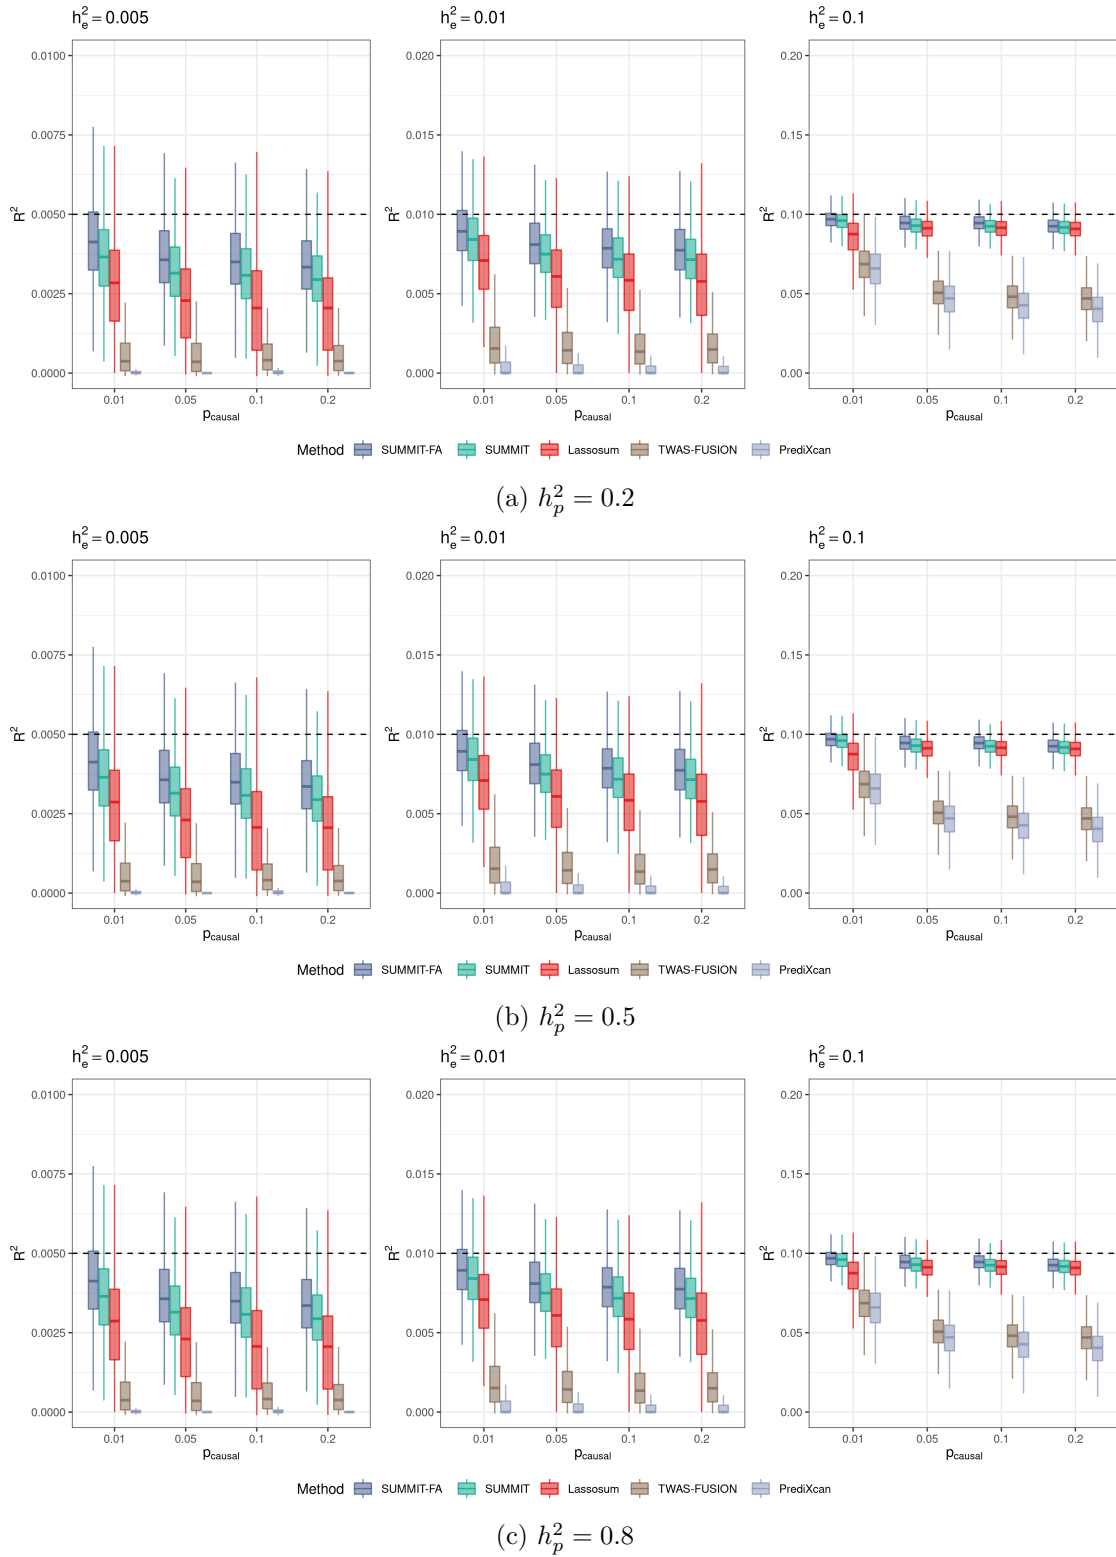

Figure 1: **Simulation performance comparison based on gene *CHURC1*.** Plots of imputation  $R^2$  in test samples by SUMMIT-FA, SUMMIT, Lassosum, TWAS-FUSION, and PrediXcan for varied proportion of causal SNPs  $p_{\text{causal}}$ , DNAm heritability  $h_e^2$ , and phenotypic heritability  $h_p^2$ .

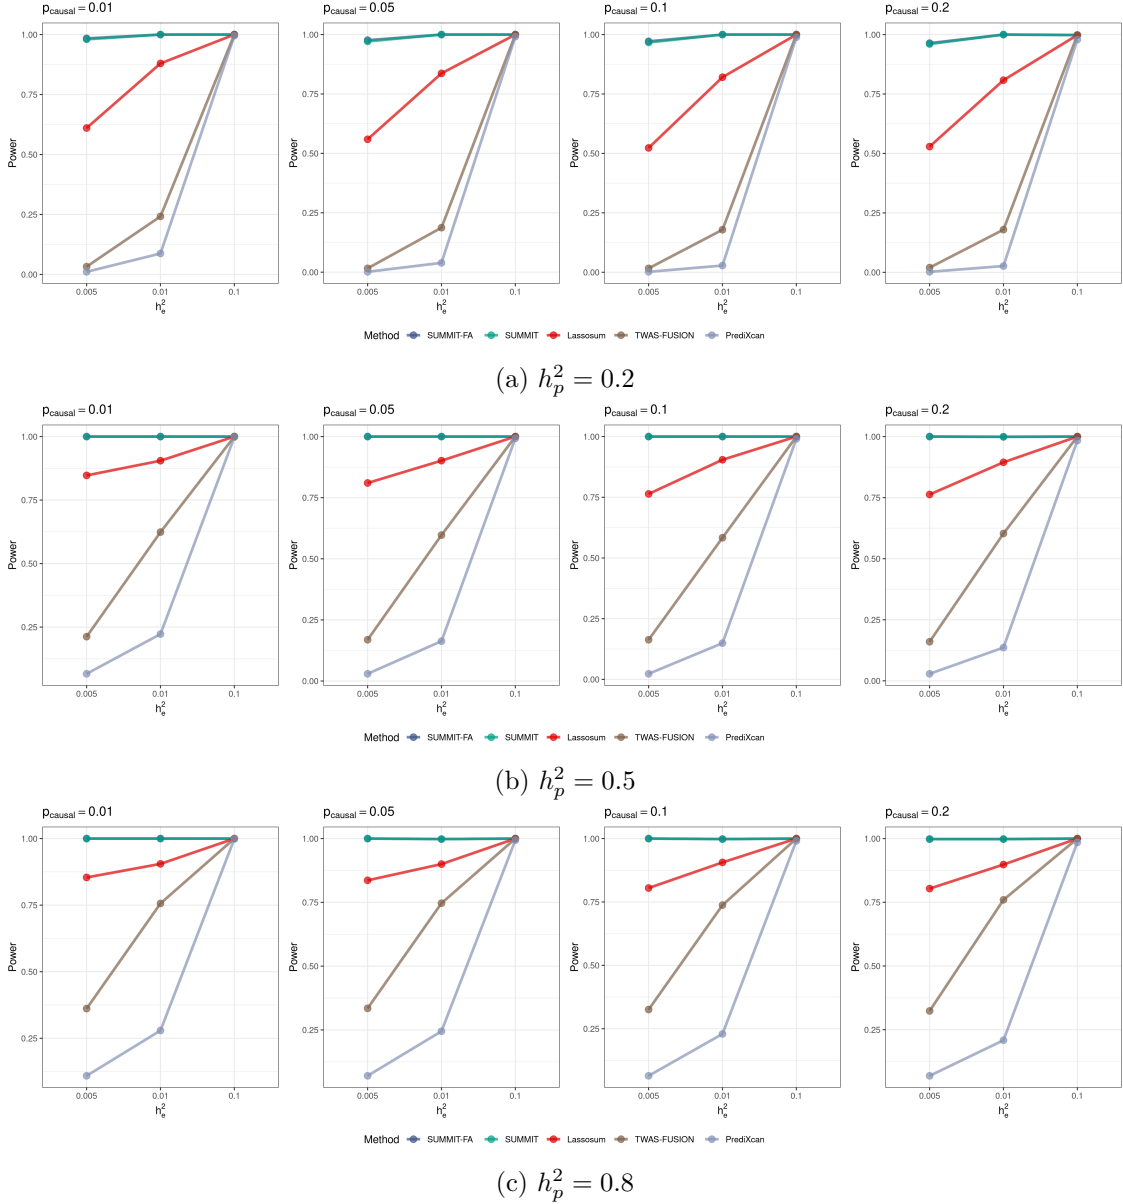

Figure 2: **Simulation performance comparison based on gene *CHURC1*.** Plots of statistical power for SUMMIT-FA, SUMMIT, Lassosum, TWAS-FUSION, and PrediXcan for varied proportion of causal SNPs  $p_{\text{causal}}$ , DNAm heritability  $h_e^2$ , and phenotypic heritability  $h_p^2$ . Empirical power was determined by the proportion of p-values  $< 2.5 \times 10^{-6}$ .

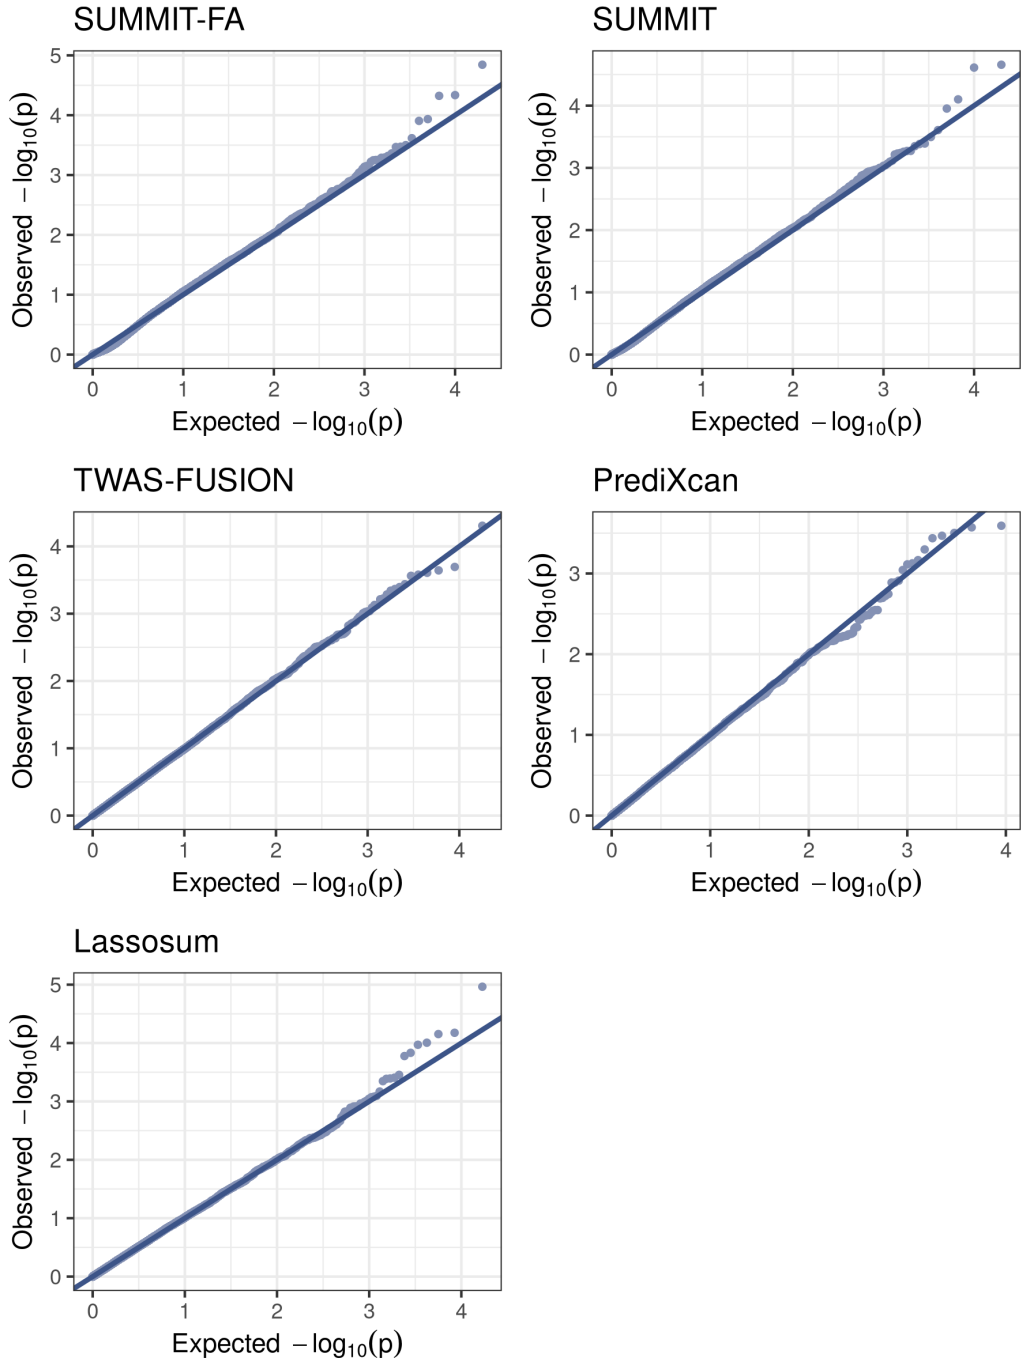

Figure 3: **QQ plots of p-values under  $H_0$**  based on the *CHURC1* gene. 20,000 replicates were run under the null hypothesis to examine type I error rates, with  $h_p^2 = 0.2$ ,  $h_e^2 = 0.005$ ,  $p_{\text{causal}} = 0.05$ .

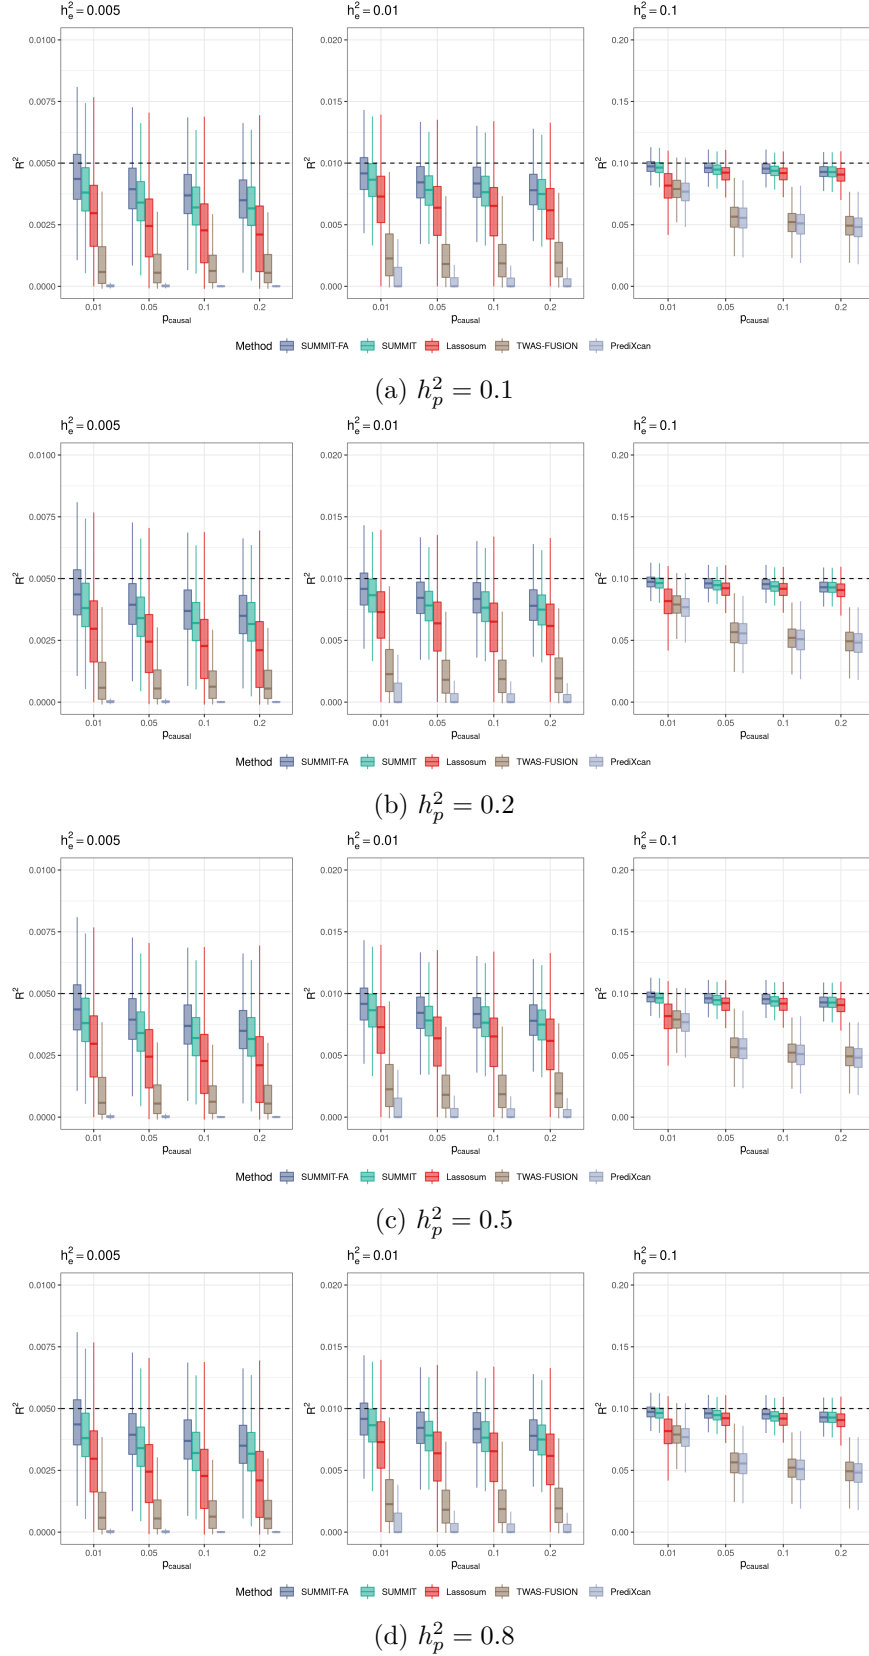

Figure 4: **Simulation performance comparison based on gene *KRIT1*.** Plots of imputation  $R^2$  in test samples by SUMMIT-FA, SUMMIT, Lassosum, TWAS-FUSION, and PrediXcan for varied proportion of causal SNPs  $p_{\text{causal}}$ , DNAm heritability  $h_e^2$ , and phenotypic heritability  $h_p^2$ .

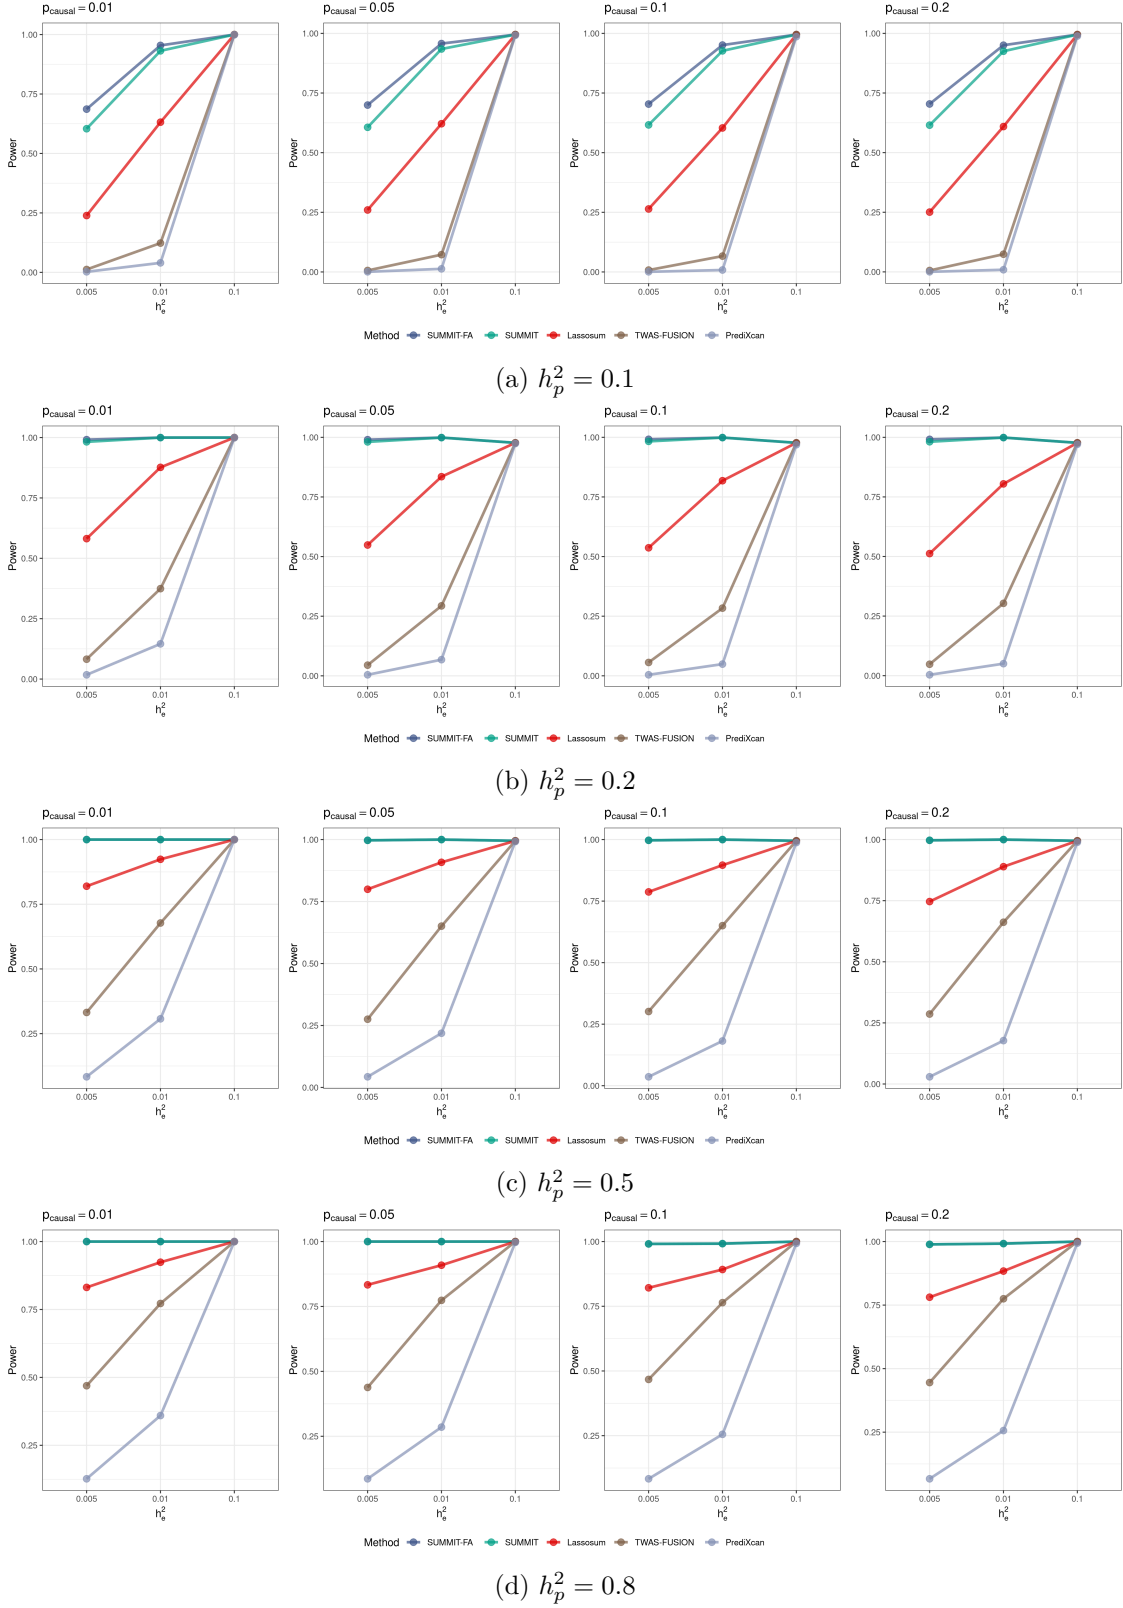

Figure 5: **Simulation performance comparison based on gene *KRIT1*.** Plots of statistical power for SUMMIT-FA, SUMMIT, Lassosum, TWAS-FUSION, and PrediXcan for varied proportion of causal SNPs  $p_{\text{causal}}$ , DNAm heritability  $h_e^2$ , and phenotypic heritability  $h_p^2$ . Empirical power was determined by the proportion of p-values  $< 2.5 \times 10^{-6}$ .
