

Supplementary Table 4: Stepwise filtering to identify individuals with likely pathogenic variants in liver genes

<b>Total WES (n=10,804)</b>	<b>Healthy control cohort (n=7856)</b>	<b>Kidney disease cohort (n=2187)</b>	<b>Liver disease cohort (n=758)</b>
Initial total variants count	215,147	57,724	19,916
Variants: QC filter	186,818	50,443	17,884
Unique variants	31,669	14,319	7,202
Pathogenic HGMD or ClinVar	1873	519	208
New Protein Truncating Variants	145	38	16
Individuals carry candidate pathogenic variants	1577 (20.1%)	416 (19.0%)	159(21.0%)
