## **Appendix**

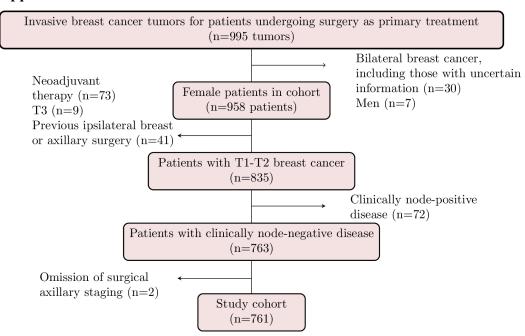

Figure S1. Patient selection for Cohort I.

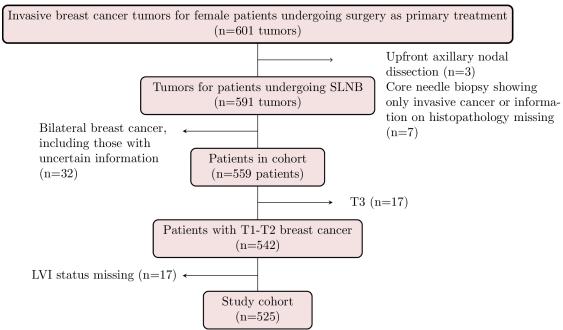

Figure S2. Patient selection for Cohort III. LVI, lymphovascular invasion, SLNB; sentinel lymph node biopsy.

Table S1. Patient and tumor characteristics in Cohort I. The number of missing values is shown for non-complete case variables.

	All patients	N0 (n=497)	N+ (n=264)
	(n=761)		
Age (years), median			
(range)

<sup>&</sup>lt;sup>a</sup> Trained on LVI status complete case data.

<sup>&</sup>lt;sup>b</sup> Trained on data with imputations of missing values of LVI status.

<sup>&</sup>lt;sup>c</sup> Trained without access to data on LVI status.

Table S4. Data characteristics in the validation cohorts for the nodal status models. No values were missing for the target variable nodal status.

	Cohort II (n=18 633)	Test cohort II (n=3727)
Models		
	N-LVI_present <sup>I</sup>	N-LVI_present <sup>I</sup>
	N-LVI_imputed <sup>I</sup>	N-LVI_imputed <sup>I</sup>
	N-LVI_absent <sup>I</sup>	N-LVI_absent <sup>I</sup>
		N-LVI_absent <sup>II</sup>
Missing values		
	3458 (2%)	644 (1%)
Complete cases		
	16 207 (87%)	3288 (88%)
N0/N+		
	14 829/3804 (80%/20%)	2966/761 (80%/20%)

Table S5. Data characteristics in the development and the evaluation cohort, respectively, for the LVI status model. No values were missing for the target variable LVI. LVI, lymphovascular invasion.

	LVI development	LVI evaluation
Dataset (N)		
	Cohort I (613)	Cohort III (525)
Missing values		
	67 (1%)	67 (1%)
Complete cases		
	550 (90%)	459 (87%)
LVI positive/LVI		
negative		
	90/523 (15%/85%)	92/433 (18%/82%)

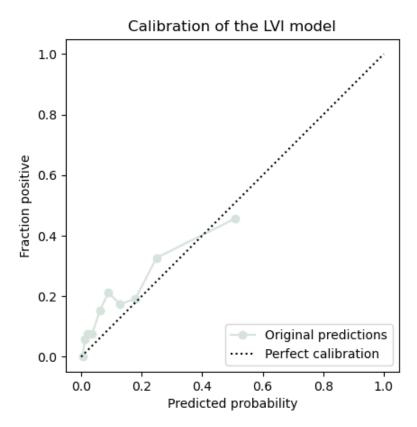

Figure S3. Calibration of the LVI model in Cohort III.

Table S7. Model architecture. All models comprised an input layer of various sizes, one hidden layer, and a one-node output layer. The models were trained during 400 epochs. The loss function was binary cross-entropy.

	Learning rate	Number of	L2	Dropout
		hidden nodes	regularization	
N-LVI_present <sup>I</sup>				
	0.05	15	None	0.4
N-LVI_imputed <sup>I</sup>				
	0.01	6	L2(0.001)	0
N-LVI_absent <sup>I</sup>				
	0.04	10	None	0.4
N-LVI_absent <sup>II</sup>				
	0.009	8	None	0.5
LVI model				
	0.15	7	None	0.1

Table S8. Sensitivity, specificity, and false negative rate for the N models. The models N-LVI\_present<sup>I</sup>, N-LVI\_imputed<sup>I</sup>, and N-LVI\_absent<sup>II</sup> were evaluated in Cohort II (n=18 633), and the model N-LVI\_absent<sup>II</sup> was evaluated in the test cohort (n=3 727) of Cohort II. FNR, false negative rate.

	N-	N-	N-	N-LVI_absent <sup>I</sup>	N-
	LVI_pre	LVI_impute	LVI_absent <sup>I</sup>	(recalibrated)	LVI_absent <sup>II</sup>
	sent <sup>I</sup>	$d^{I}$			
Sensitivity					
	91%	90%	90%	92%	91%
Specificity					
	25%	27%	24%	20%	30%
FNR					
	9%	9%	10%	8%	9%

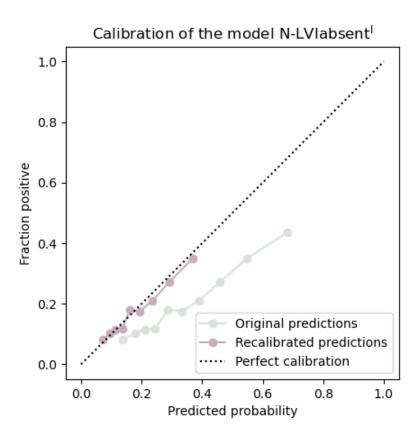

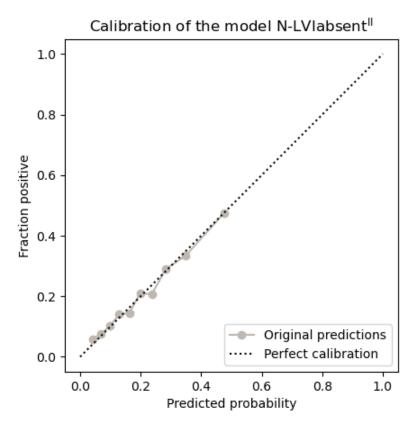

Figure S4. Calibration and recalibration of the N status model N-LVI\_absent<sup>I</sup> in the test cohort of Cohort II. N, nodal.

 $\textit{Figure S5. Calibration of the N status model N-LVI\_absent^{II} in the test cohort of Cohort II.\ N, nodal.}$ 

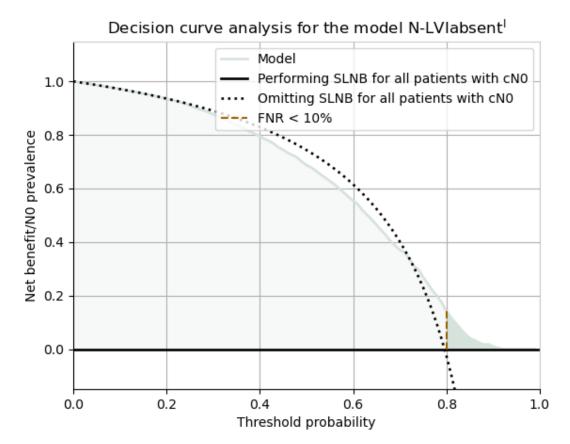

Figure S6. Standardized decision curve analysis for the original predictions of model N- $LVI_a$  absent!. The black horizontal line represents the scenario of all patients being diagnosed as node-negative; hence, no SLNB is performed. The colored function represents the diagnosis by the model. The golden, dashed, vertical line separating the lighter color from the darker shows the threshold for FNR < 10%. When all patients are considered node-positive and diagnosed through SLNB, the standardized net benefit is, by definition, zero. Note that the darker, colored area does not represent the patients spared from surgery. Rather, it displays the standardized net benefit of the model where FNR < 10%. cN0, clinically node negative; FNR, false negative rate; SLNB, sentinel lymph node biopsy.
