52 Note: For the benchmark analyses, four tools were used to integrate a large-scale meta-GWAS  
 53 summary statistics on severe COVID-19 round 4 (N = 969,689 samples, Supplementary Table S1)  
 54 with scRNA-seq dataset on PBMCs (N = 514,400 cells, Supplementary Table S2) with COVID-19  
 55 of varying clinical severity, including severe, moderate, mild, and healthy controls. The GWAS  
 56 summary dataset were downloaded from COVID-19 Host Genetics Consortium  
 57 (<https://www.covid19hg.org/>; analyzed file named:  
 58 “COVID19\_HGI\_B2\_ALL\_leave\_23andme\_20201020.txt.gz”; released date of October 4 2020).  
 59 There were 7,885 hospitalized COVID-19 patients and 961,804 control participants from 21  
 60 independent contributing studies. To compare the significant levels of these methods in Figure 5A-  
 61 D, we used the log transformation for the P values that were adjusted by using the Bonferroni  
 62 correction method.

83 Note: We chose top-ranked 1,000 risk genes for AD from the genetic co-expression  
84 analysis to perform differential gene expression analyses based on two bulk-based  
85 transcriptomic profiles (GSE109887, n = 78; GSE15222, n = 363). We found that 421  
86 genes showed significantly positive associations with AD (42.1%) among two independent

87 bulk-based transcriptomic datasets. We used two-sided Student's T test to assess the  
88 significance for each gene. NA: Not applicable.
