

Cancer model:

- Virtual tumor sphere of volume « V » and radius « R » = $D/2$
- D = sum of target lesions per RECIST 1.1
- Tumor sphere growth: exponential function of time « t »

$$V = 4 \pi R^3 / 3$$

$$V_t = V_0 \exp(\text{TG}.t)$$

$$\text{TG} = 3 \log(D_t/D_0)/t$$

$$\text{TGR} = 100 (\exp(\text{TG}) - 1)$$

Growth rate, in %/month, of the volume of the global virtual tumor sphere
