**Table A.1 Impact of motor eloquent ischemia.** Treatment effects (mean group differences/odds ratios, 95% confidence intervals, p-values) for different outcomes (based on separate models for each outcome, adjusted for baseline measures and including time point, group and interaction group\*time point) in the subgroup of patients with motor eloquent ischemia (n=16; 5 in rTMS group, 11 in sham group; 48 measures per model). Models for the finger tapping and distal BMRC scores did not converge when the interaction term for group \* time point was included. They were therefore analysed only with a main effect for group and time point. Estimates are based on mixed models or GEEs. prox = proximal muscles, dist = distal muscles, KPS = Karnofsky Performance Status, NHPT = Nine-Hole Peg Test.

Before imputation (complete case analysis)
