<sup>1</sup>Duplex PCR was carried out to 45 cycle thresholds for *P. malariae* and *P. ovale* spp. detection; however, samples were considered positive if amplification under 40 Cts only, due to observed variability in this assay at later cycle thresholds.

<sup>1</sup> The survey-based population comprises all participants in the study, as all participants completed the Baseline household survey. The clinic-based sub-population comprises a subset of the survey-based population who had at least 1 symptomatic clinic visit during the study period.

<sup>2</sup> Fever at Baseline survey was self-reported as "fever in the prior week"

<sup>3</sup> p-values compare baseline characteristics between those in the survey-based population who were vs. were not also included in the clinic-based symptomatic population.

**Supplemental Table 3. Baseline subject characteristics by species for the symptomatic clinic subpopulation**

<sup>1</sup> Fever was self-reported as "fever in the prior week"

<sup>2</sup> Self-reported use of antimalarials in prior 6 months.

<sup>3</sup> Categorical variables were statistically compared using chi-squared tests; continuous variables were compared using the Kruskal-Wallis test of medians to account for non-normality. Missing data were excluded from statistical tests.

<sup>4</sup> p-values tested using Fisher's exact testing due to small cell sizes.

**Supplemental Table 5. Participant characteristics across follow-up (Clinic Subpopulation)**

<sup>1</sup> Fever was measured at time of clinic visit.

<sup>2</sup> Clinic visits could continue past the end of active surveillance till the end of 2017, for a total of 34 months from the first baseline visit. Clinic visits after 24 months occurred after all household surveys had concluded.

<sup>3</sup> Categorical variables were statistically compared using chi-squared tests; continuous variables were compared using the Kruskal-Wallis test of medians to account for non-normality. Missing data were excluded from statistical tests.

<sup>4</sup> p-values tested using Fisher's exact testing due to small cell sizes.

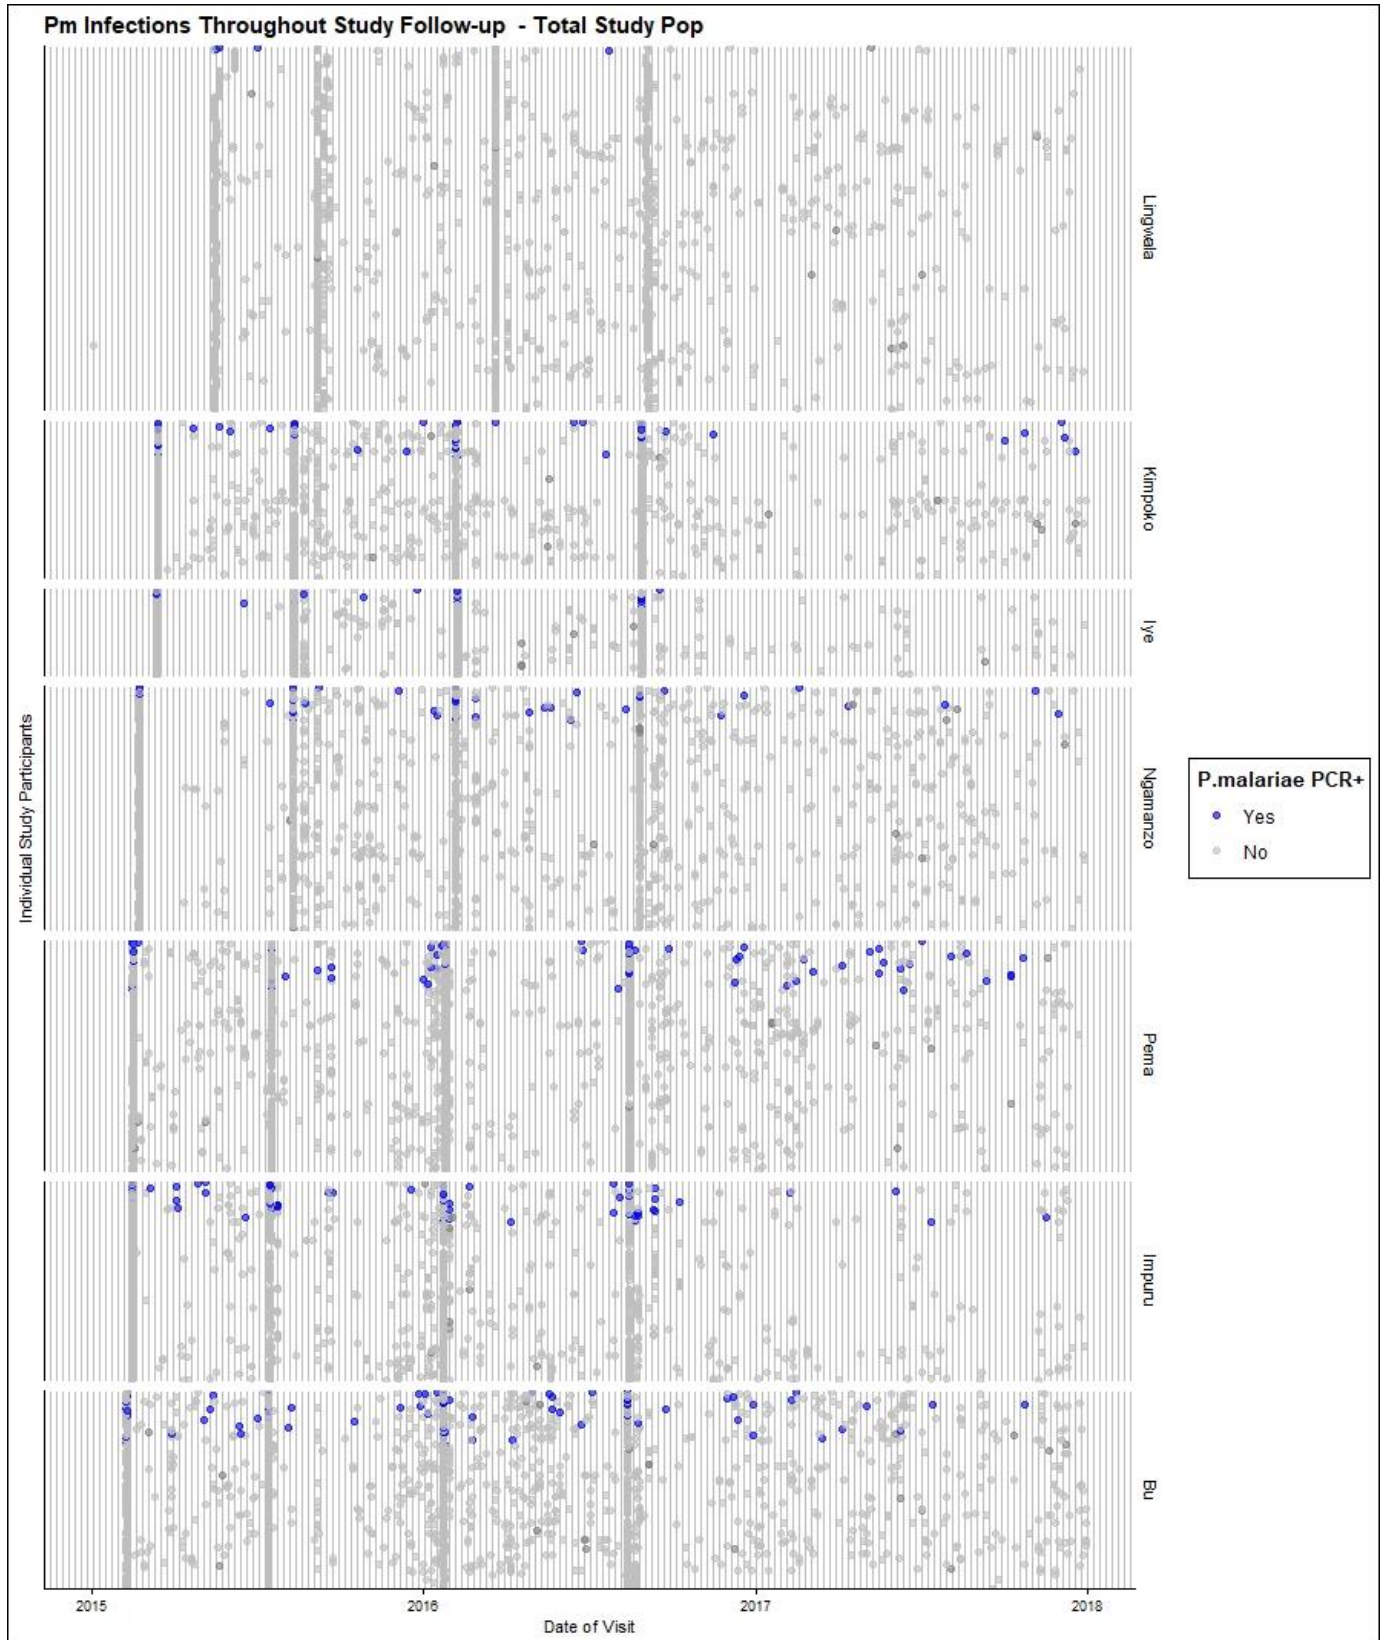

**Supplemental Figure 1 A-B. ) Factors associated with *P. malariae* and *P. ovale* spp. infection prevalence, compared to *P. falciparum*, stratified by study population.**

A) Factors associated with non-falciparum infection prevalence compared to *P. falciparum* infection, at survey visits (baseline and three follow-up surveys). B) Factors associated with non-falciparum infection prevalence compared to *P. falciparum* infection, at clinic visits throughout follow-up.

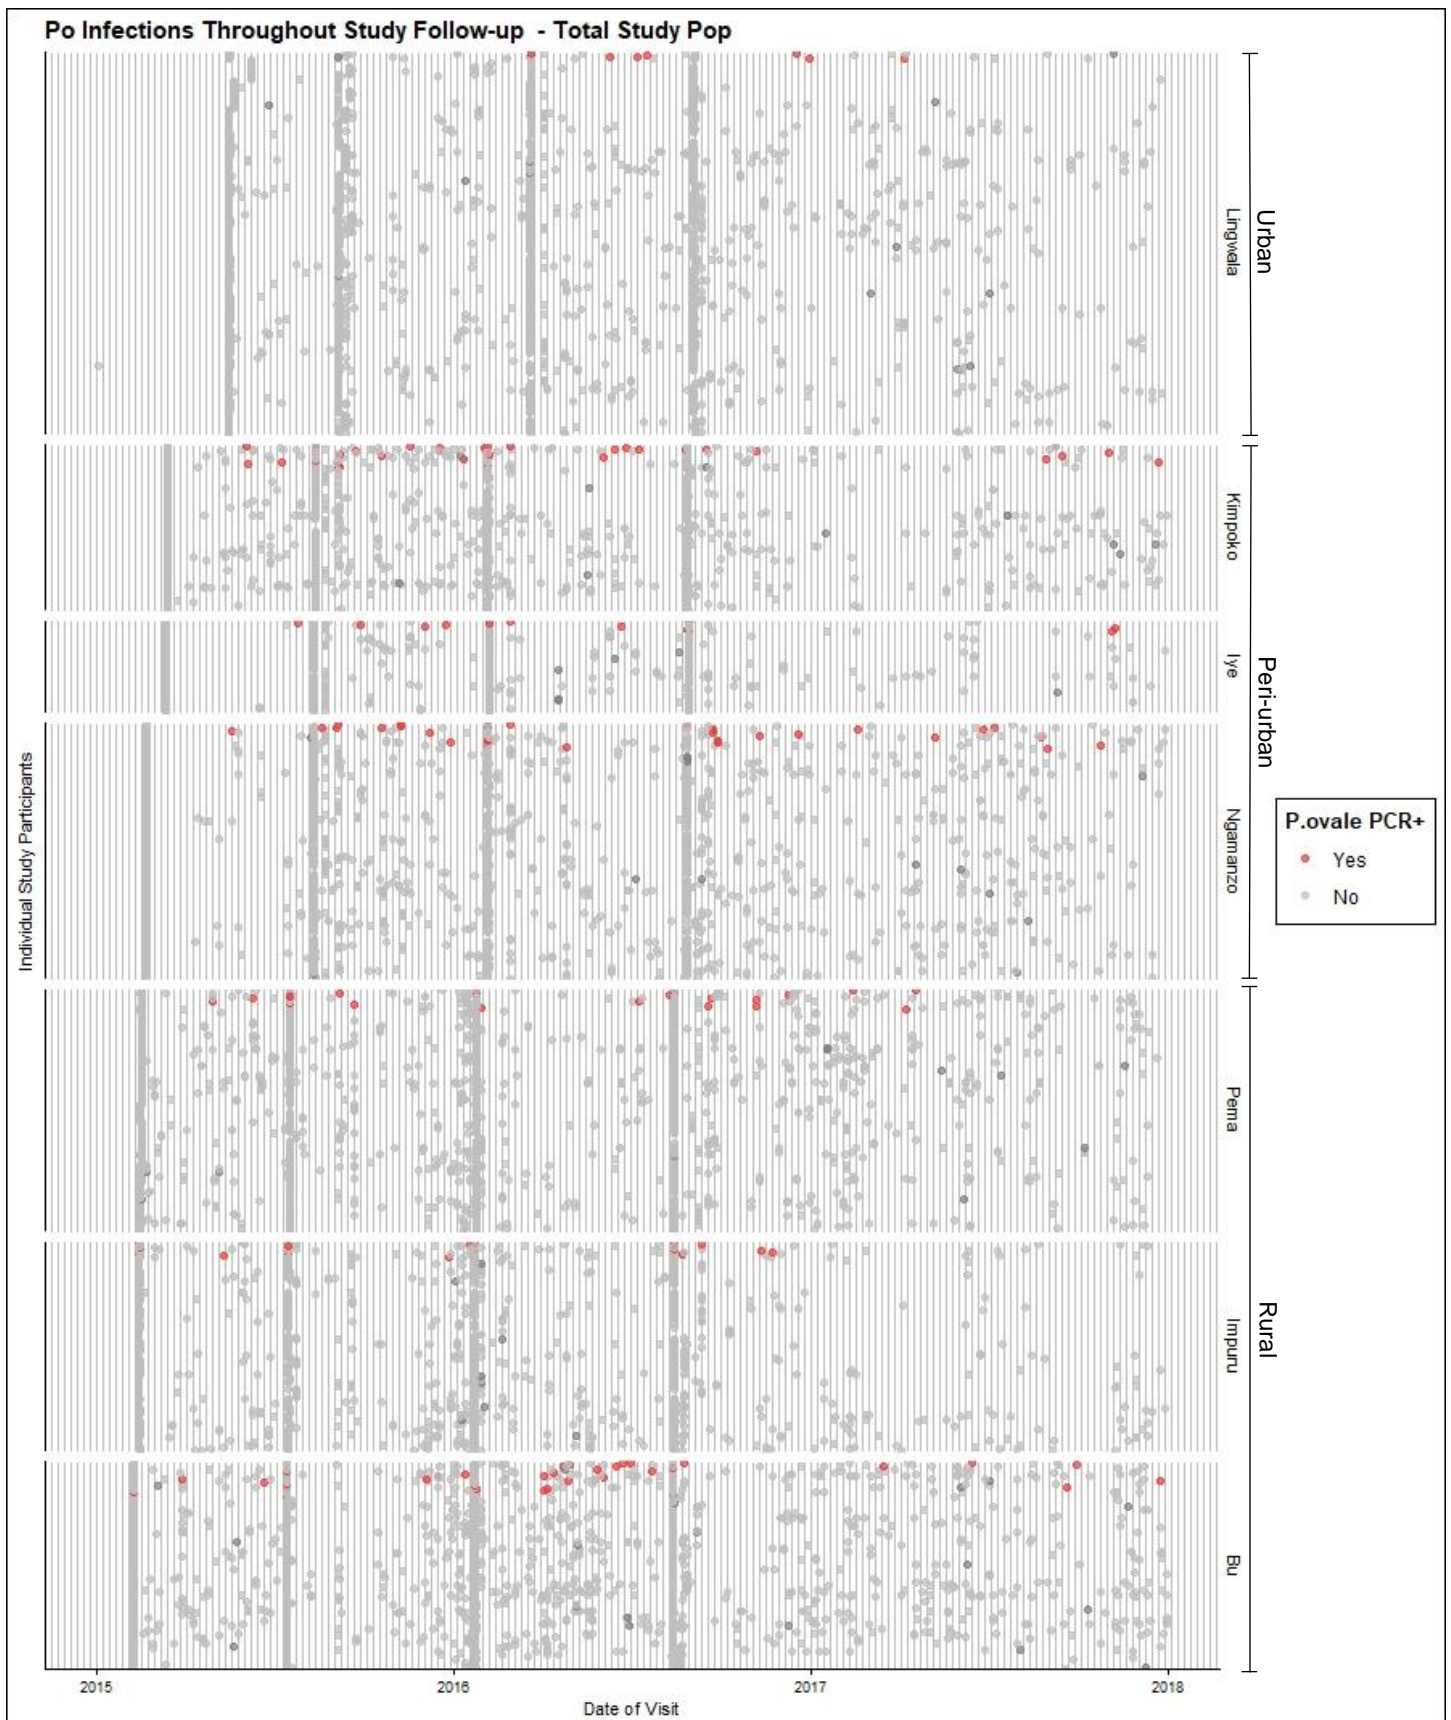

Supplemental Figures 2 A-D. *P. malariae* and *P. ovale* spp. infections throughout the study period, within the Total Population, encompassing infections detected at all touch points in the study (survey + clinic visits).

A.

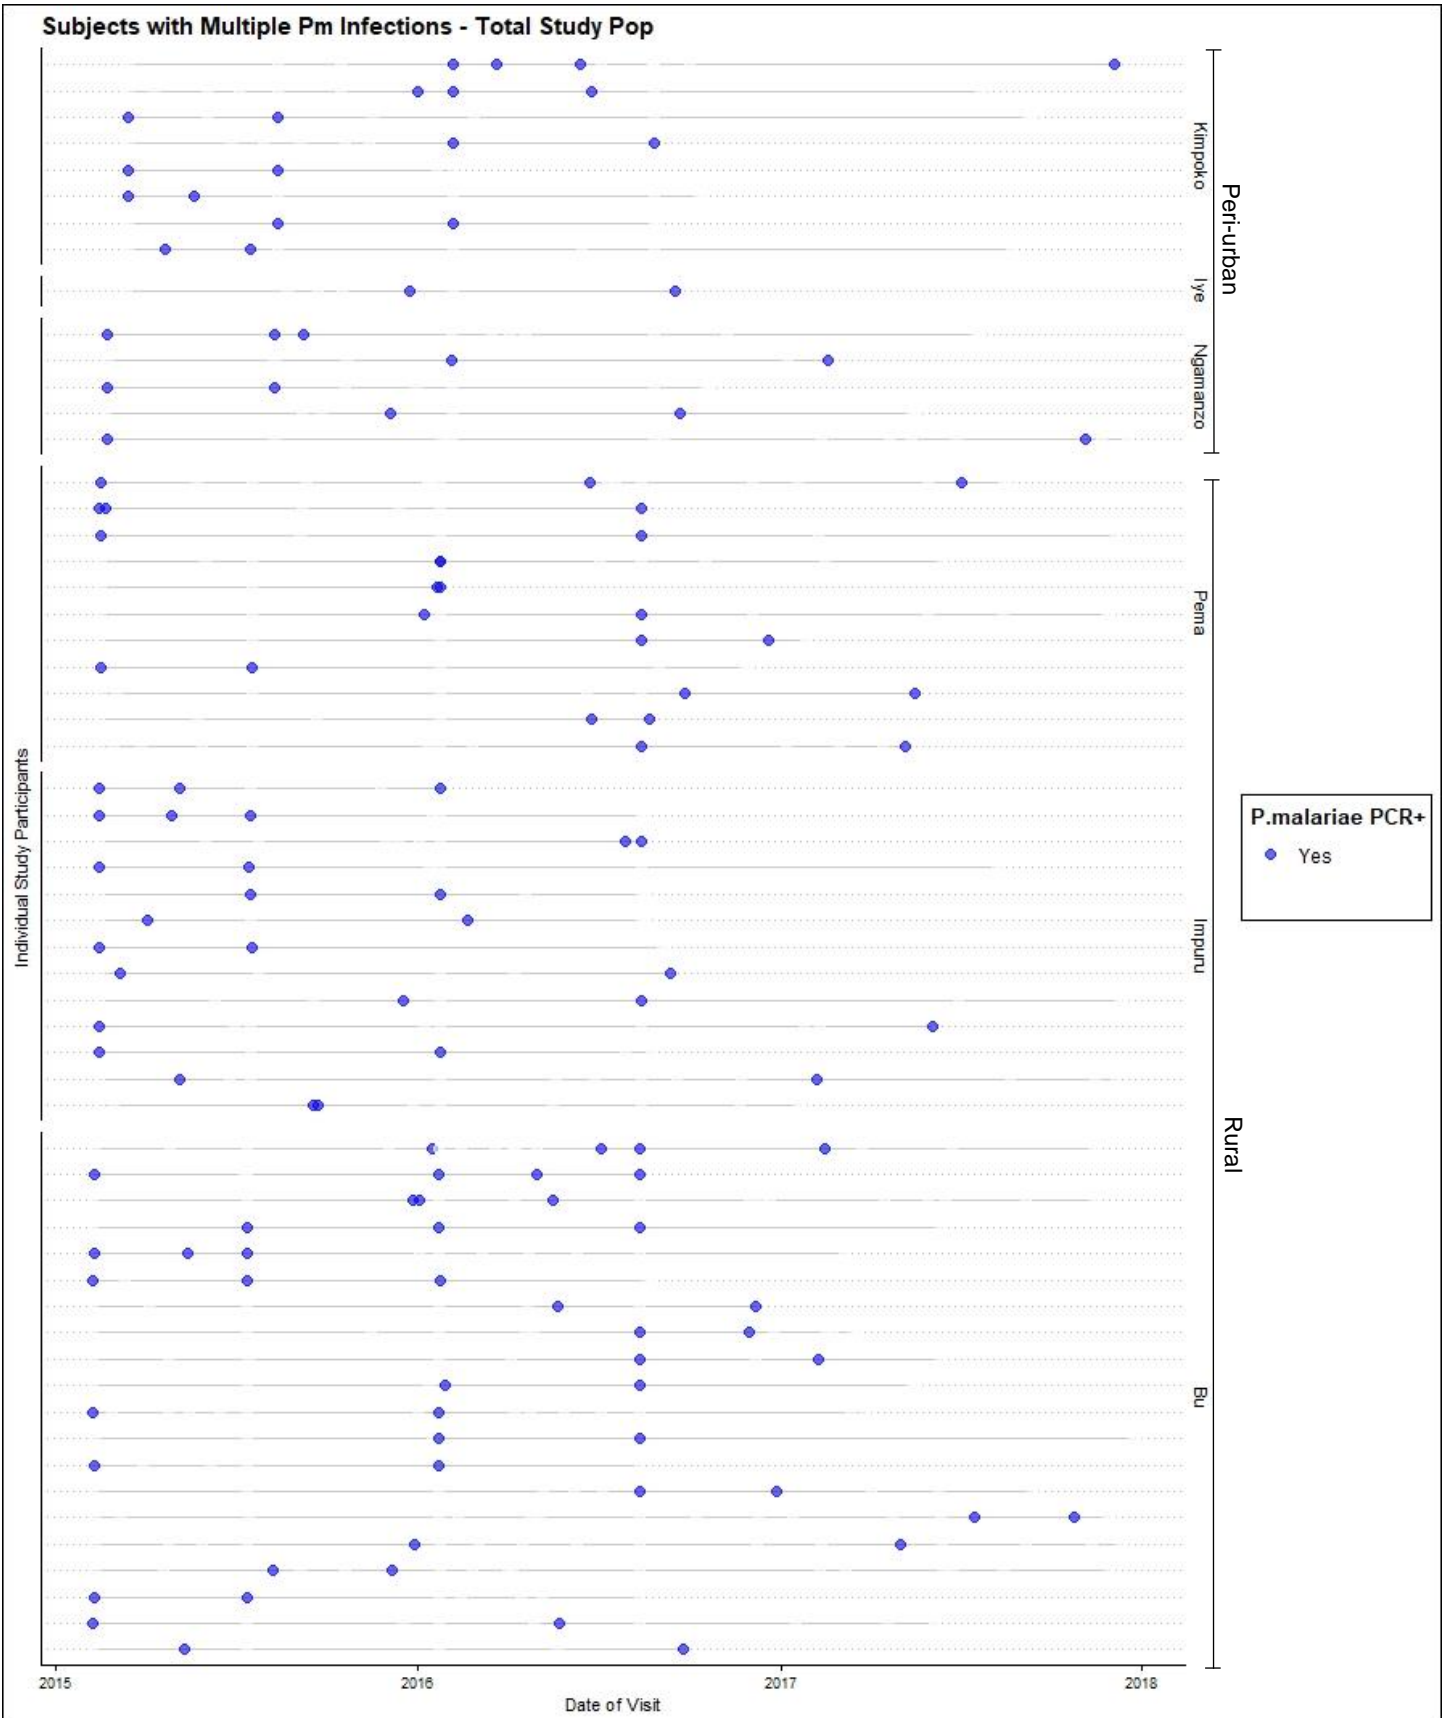

A) *P. malariae* infections detected at study visits throughout follow-up, among all subjects in the Total Population. Rows represent individual subjects, sorted by frequency of PCR+ *P. malariae* infections throughout the full study period.

B

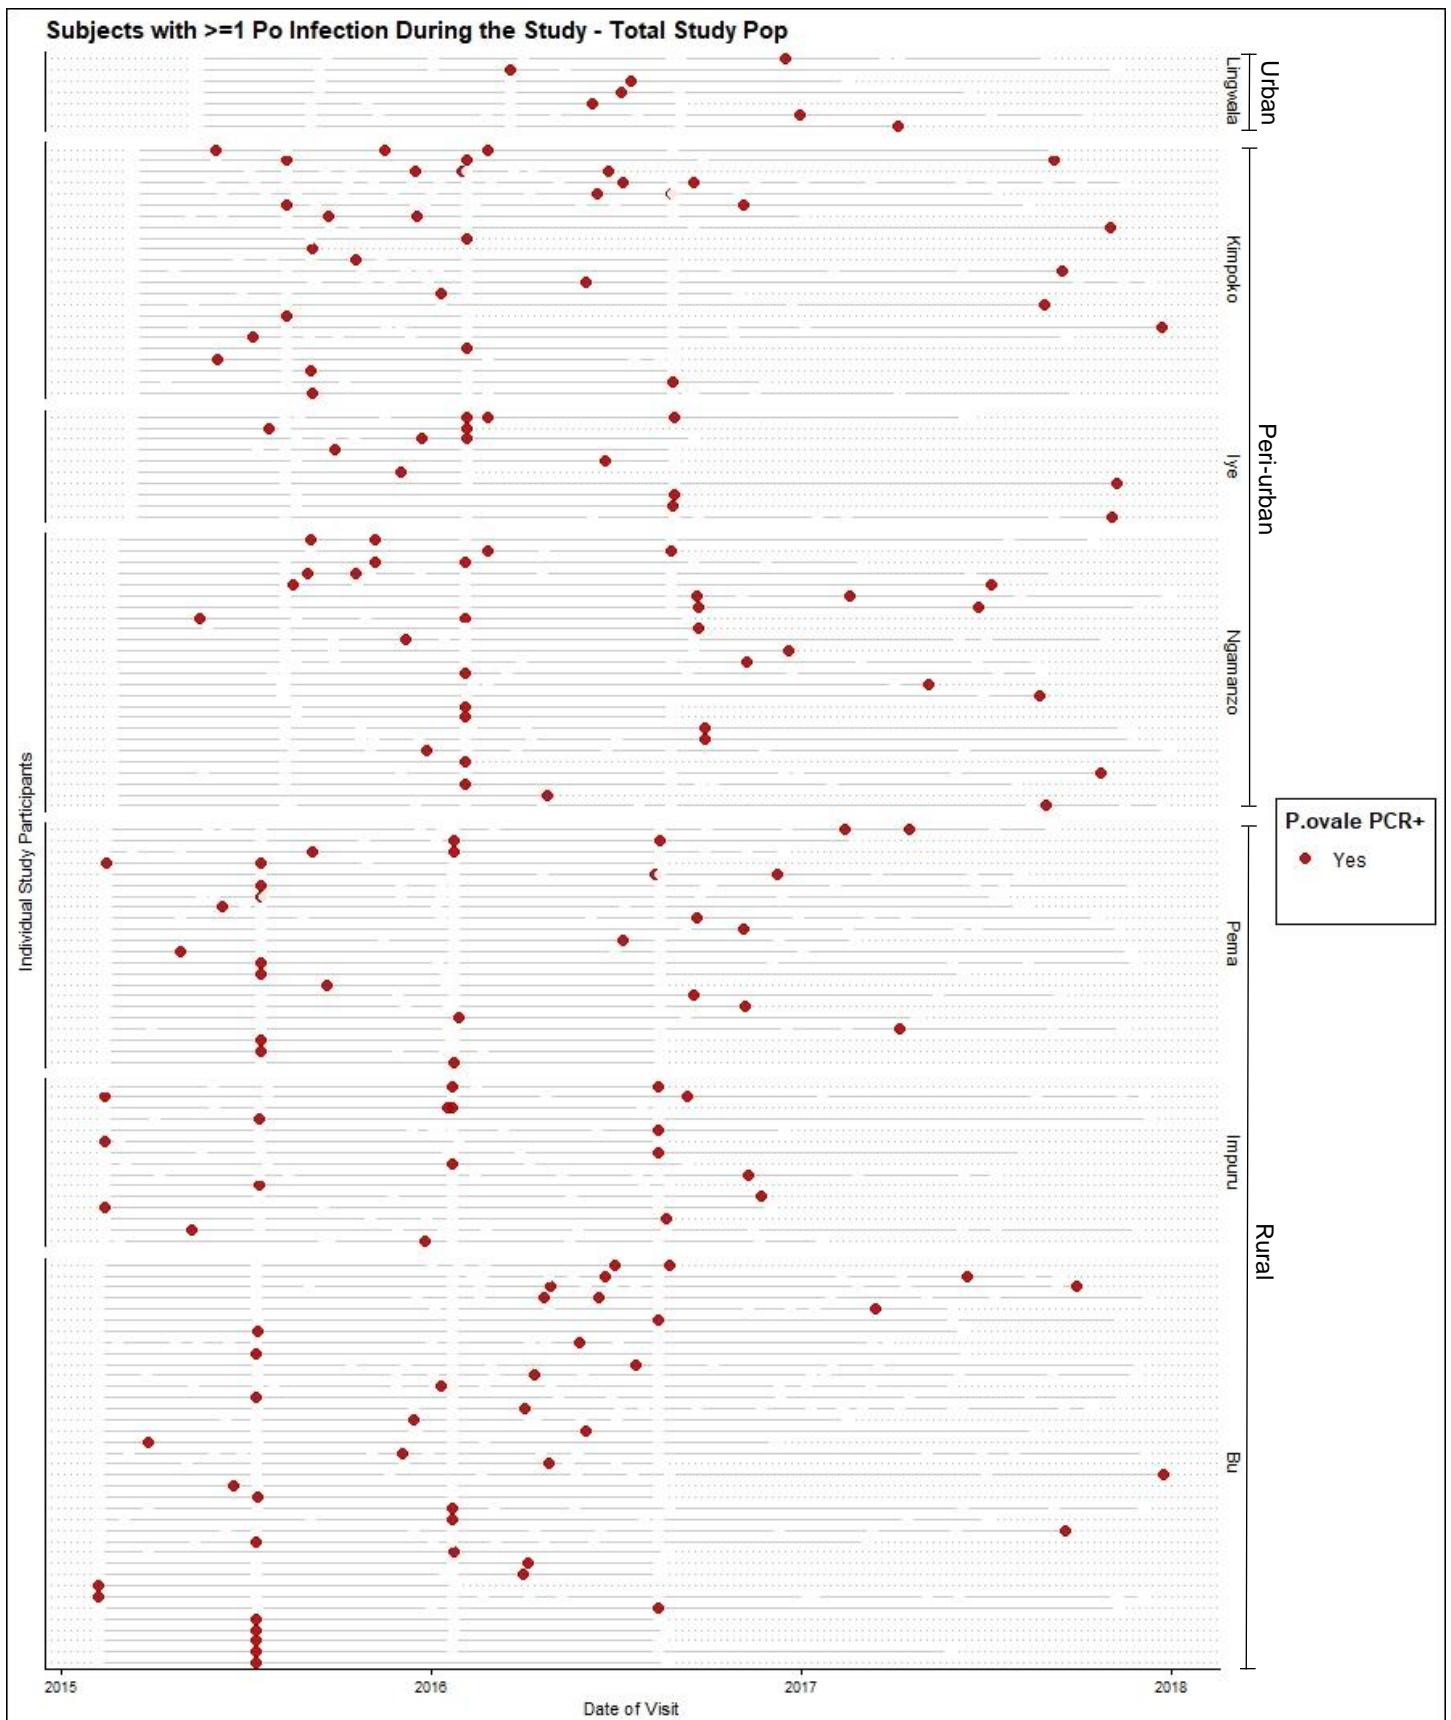

B) *P. ovale* spp. infections detected at study visits throughout follow-up, among all subjects in the Total Population. Rows represent individual subjects, sorted by frequency of PCR+ *P. ovale* spp. infections throughout the full study period.

C

C) Multiple *P. malariae* infections detected at study visits throughout follow-up, among all subjects in the Total Population who had at least one *P. malariae* infection during the study. Rows represent individual subjects, sorted by frequency of PCR+ *P. malariae* spp. infections throughout the full study period.

D

D) Multiple *P. ovale* spp. infections detected at study visits throughout follow-up, among all subjects in the Total Population who had at least one *P. ovale* spp. infection during the study. Rows represent individual subjects, sorted by frequency of PCR+ *P. ovale* spp. infections throughout the full study period.

**Supplemental Table 6. Estimated parasitemias (p/μL) by malaria species**
