Heritability of multi-organ imaging biomarkers

It has been shown that the CMR and brain MRI exists certain heritability by many twin and family studies¹⁻³. However, the level of heritability might differ with respect to different heart or brain
regions. For example, large brain volumes and cortical regions involved in language, executive function, and emotional regulations are usually consistently high in heritability^{1,4}. Most of the brain structural MRI traits has relatively strong heritability, ranging from 0.6 to 0.8⁴ compared with 0.2 to 0.6 heritability of brain functional connectivity⁵. Cardiac MRI traits are also heritable⁶, such as ascending aortic⁷ and left ventricular structure⁸. The heritability of all abdominal IDPs is significant, which suggests that genetic differences account for a substantial portion of the variation among individuals. The inclusion of height and BMI as additional covariates has minimal impact on heritability. More detailed information about abdominal IDPs can be found in Liu, et al.⁹. All skeletal proportions are highly heritable (0.4-0.5) and the range in twin studies is between 0.4 and 0.8¹⁰.

Fig. S1 Frequency of imaging traits and clinical endpoints. See **Table S1** for the frequency of the imaging traits and clinical endpoints. Skeleton imaging traits include 6 DXA traits, which measure the length or width of human long bones. Brain imaging traits include three modalities, namely 110 DIT parameters, 90 network-level phenotypes from functional MRI, and 101 regional brain volumes. Heart imaging traits include 3 from AAO, 3 from DAO, 4 from the LA, 64 from the LV, 4 from the RA, and from 4 the RV. Abdominal traits measure the percent fat or iron content of different organs or tissues, such as adipose, kidney, liver, lung, pancreas, and spleen. Clinical outcomes include selected phenotypes from the Finngen database covering 11 categories.

Fig. S2 Mendelian Randomization when clinical endpoints are exposure and brain imaging traits are the outcome. (A) The causal effect of clinical outcomes on brain imaging traits. The chord plot displays the connection between each causal pair. The first level (out) circle indicates each disease category or brain modality. The second level (middle) circle indicates the specific diseases within each disease category or fMRI/regional brain volume/DTI parameters within each brain modality. The third level circle on the brain feature side indicates which diseases the brain feature links to. The abbreviations in the legend can be found in **Table S1**. (B)(D) The circle bar plot showed the number of unique brain imaging traits and clinical outcomes that were significant in the results by category. (C)(E) The circle bar plot showed the frequency of each brain imaging trait and disease by category. The legend color can be found in (A).

Fig. S18 Genetic causal effects of heart imaging biomarkers on heart-related diseases. We illustrated selected significant ($P < 6.85 \times 10^{-6}$) causal genetic links from heart imaging biomarkers to (Exposure) to clinical endpoints (Outcome) after adjusting for multiple testing using the Bonferroni procedure. IDP Category, category of imaging biomarkers; #IVs, the number of genetic variants used as instrumental variables. Different MR methods and their regression coefficients are labeled with different colors. See **Table S1** for the data resource of clinical endpoints and **Table S2** for data resources of imaging biomarkers.

Fig. S19 Mendelian Randomization with clinical endpoints being the exposure and abdominal imaging traits being the outcome. (A) The causal effect of clinical outcomes on abdominal imaging traits. The chord diagram displays the connection between each causal pair. The first level (out) circle indicates each disease category or abdominal category. The second level (middle) circle indicates the specific diseases within each disease category or abdominal imaging traits within each abdominal category. The third level circle on the disease's feature side indicates which diseases the heart feature links to. The abbreviations in the legend can be found in **Table S1**. (B)(D) The circle bar plot showed the number of unique abdominal imaging traits and clinical outcomes that were significant in the results by category. (C)(E) The circle bar plot showed the frequency of each abdominal imaging trait and disease by category. The legend color can be found in (A).
