

## Supplementary Material

### Contents

Table S1: Search Strategy.....	2
Table S2: Data Extraction Table of Included Study Characteristics .....	23
Table S3: Data Extraction Table of Challenges Reported. ....	45
Table S4: Adapted QUADAS-2 Tool.....	50
Table S5: Blood Sample, Volume and Result Time Required for included POC(Hb)Ts.....	51
Figure S1: QUADAS-2 Risk of Bias and Applicability Concerns for Included Diagnostic Studies .....	53
Table S6: Justifications for Quality Assessment Judgements. ....	54
References .....	63

### Abbreviations

POC(Hb)T: Point-of-care haemoglobin test

LMICs: Low-and middle-income countries

**Supplementary Table S1: Search Strategy**

Concepts 1-4 (combined with AND operator):

1. Anaemia
2. POC Hb tests
3. LMICs
4. Clinical Setting

Truncations and subject headings were adapted to each database.

LMIC filters were adapted from Cochrane Effective Practice and Organisation of Care filters for LMICs and updated according to World Banks Classification 2022.<sup>1, 2</sup> 28 countries were removed, and two countries added (Kiribati and Tuvalu) due to change in class. Venezuela was unclassified in 2022 and so remained included.

Entire platforms were searched on 10<sup>th</sup> June 2022 and English language filters applied.

**Supplementary Table S2: Data Extraction Table of Included Study Characteristics**

Study and publication/ registration year	Study design	Aim of study	Population and sample size (for those undergoing POC Hb testing if provided)	Location and setting	POC Hb test(s) used (blood sample and timing if provided)	Percentage of patients diagnosed with mild/moderate /severe/overall anaemia and/or mean Hb concentration by POC(Hb)T
1. Alamneh <i>et al.</i> , 2021 <sup>3</sup>	Cross-sectional	To assess the magnitude and associated factors of anaemia among children aged 6-59 months attending at Debre Markos Referral Hospital, Northwest Ethiopia	310 children 6-59 months (<5 years) (All children included, except those with severe medical conditions)	Debre Markos Referral Hospital, Northwest Ethiopia	HemoCue 301 (capillary and venous)	Mild (10-10.9 g/dl): 7.1% Moderate (7-9.9g/dl): 3.5% Severe (<7g/dl): 1.3% Overall: 11.9% (95% CI: 8.5-16.2)
2. Aldridge <i>et al.</i> , 2012 <sup>4</sup>	Diagnostic study	To estimate the diagnostic accuracy of HCS in preschool-age children when used in real-life conditions, relative to a reference method (HemoCue) and to the Integrated Management of Childhood Illness (IMCI) recommended method (clinical examination for palmar pallor)	788 children aged 2-59 months (All children included)	6 Mother and Child Health Clinics on Pemba Island in the Zanzibar archipelago, Tanzania (Gombani, Kiuyu, Shidi, Vumba, Bogoa and Kiwani)	HCS (capillary) and HemoCue (capillary)	Severe (<5g/dl): 0.8% (95% CI: 0.3-1.6) Overall (<11g/dl): 71% (95% CI: 68-74) Mean Hb (HemoCue): 10.1g/dl (95% CI: 10.0-10.2) Mean Hb (HCS): 11.6 g/dl (95% CI: 11.5-11.8)
3. Bojang <i>et al.</i> , 2011 <sup>5</sup>	RCT	To compare the effectiveness of delivery of intermittent preventative	12,326 children 6 months - 6 years	26 rural reproductive and child health	HemoCue	Mean±SD Hb: RCH (n=525)

Study and publication/ registration year	Study design	Aim of study	Population and sample size (for those undergoing POC Hb testing if provided)	Location and setting	POC Hb test(s) used (blood sample and timing if provided)	Percentage of patients diagnosed with mild/moderate /severe/overall anaemia and/or mean Hb concentration by POC(Hb)T
		treatment for malaria to Gambian children <6 years by virtual health workers (VHWs) and reproductive and child health (RCH) trekking teams	68 children admitted to one of the health facilities in the study area during follow-up period and therefore had Hb assessed (30 in RCH and 36 in VHW)	clinics on the south bank of Upper River Region, The Gambia	(Secondary endpoint of study – morbidity surveillance – Hb measured when referred to health facility)	10.2±2.0g/dl VHW (n=571) 10.4±2.0 g/dl  Moderate anaemia (Hb<7g/dl): RCH: 6.1% VHW: 4.8%
4. Bond <i>et al.</i> , 2014 <sup>6</sup>	Diagnostic study	To evaluate the accuracy of HemoSpec in the field	70 children aged 0-15 years	Paediatric ward of Queen Elizabeth Central Hospital, Blantyre, Malawi	HemoSpec (capillary)	Not reported
5. Calis <i>et al.</i> , 2016 <sup>7</sup>	Case-control	To assess the causative factors in Malawian children with SA	1138 children aged 6-60 months (case patients with SA (Hb<5g/dl) = 381, community control (healthy children	Outpatient department at Chikwawa District Hospital (rural) and Queen Elizabeth Referral Central Hospital (urban	HemoCue	Mean±SD Hb:  Case patients: 3.6±0.8g/dl  Community control: 9.9±1.9g/dl

Study and publication/ registration year	Study design	Aim of study	Population and sample size (for those undergoing POC Hb testing if provided)	Location and setting	POC Hb test(s) used (blood sample and timing if provided)	Percentage of patients diagnosed with mild/moderate /severe/overall anaemia and/or mean Hb concentration by POC(Hb)T
			Hb>5g/dl) = 380, hospital control (Hb>5g/dl)= 377)	Blantyre), Malawi		Hospital control: 9.6±2.2g/dl
6. Choukem <i>et al.</i> , 2020 <sup>8</sup>	Diagnostic study	To evaluate the technical and clinical accuracy of two POC haemoglobin meters and their agreement with a reference analyser in diagnosing anaemia in the African setting	All children and adults aged 4 -85 years  (12 children aged 4-14 years) (216 aged >15 years)	Inpatient and Outpatient departments at Douala General Hospital, in Douala capital city of Cameroon	URIT-12 (capillary) and Mission Hb (capillary)	N/A - only reported for pooled children and adults sample
7. Cusick <i>et al.</i> , 2016 <sup>9</sup>	RCT	1) Determine values of iron and inflammatory markers in children with severe malarial anaemia (SMA) or cerebral malaria (CM) and also in healthy community children (CC) before antimalarial treatment 2) Establish whether the 28-day values of iron and inflammatory markers differed between children in each group who received iron with their antimalarial treatment	239 children aged 18 months- 5 years (SMA = 77, CM = 79, CC = 83)	Mulago hospital, Kampala, Uganda	HemoCue (venous)  Baseline and hospital follow-up at 28 days	Mean±SD Hb: SMA: 3.74±0.95 g/dl CM: 6.99±1.89 g/dl CC: 11.72±1.23 g/dl

Study and publication/ registration year	Study design	Aim of study	Population and sample size (for those undergoing POC Hb testing if provided)	Location and setting	POC Hb test(s) used (blood sample and timing if provided)	Percentage of patients diagnosed with mild/moderate /severe/overall anaemia and/or mean Hb concentration by POC(Hb)T
		compared with those who received antimalarial treatment alone				
8. Cusick <i>et al.</i> , 2016 <sup>10</sup> NCT01754701*	RCT	To determine whether iron supplementation given concurrently with antimalarial treatment compared with 4 weeks after antimalarial treatment is better incorporated into RBCs and improves haematologic recovery at 8 weeks	100 children aged 6-59 months with fever and malaria	Paediatric Acute Care Unit at Mulago Hospital, Kampala, Uganda	HemoCue  Baseline – to assess trial eligibility	Mean Hb: 8.0 g/dl
9. Study and publication/ registration year	Study design	Aim of study	Population and sample size (for those undergoing POC Hb testing if provided)	Location and setting	POC Hb test(s) used (blood sample and timing if provided)	Percentage of patients diagnosed with mild/moderate /severe/overall anaemia and/or mean Hb concentration by POC(Hb)T
Anaemia in African Children (EARS) Trial						

POC(Hb)T = Point-of-care Haemoglobin Test. POC = Point-of care. Hb = Haemoglobin. HCS = Haemoglobin Colour Scale. SA = Severe anaemia. RCT= Randomised Controlled Trial. SD = Standard deviation. mg = milligram. CI = confidence Interval. CBC = Complete blood count. RBC = Red blood cell. SAE's = Severe adverse events. SCA = Sickle cell anaemia. SCD = Sickle cell disease. \* Some information extracted from related/supporting documents.

**Supplementary Table S3: Data Extraction Table of Challenges Reported.**

Study	POC Hb test(s) used	Challenges to POC Hb test use reported
1. Aldridge <i>et al.</i> , 2012 <sup>4</sup>	HCS	"Considerable inter-observer variability between HCS readers – lack of training (only 1 hour provided)" "HCS overestimated Hb compared with HemoCue by 1.3/dl" "LOA too wide to be clinically acceptable" "Sensitivity and specificity clinically unacceptable"
2. Bond <i>et al.</i> , 2014 <sup>6</sup>	HemoSpec HemoCue 201+	Clinically unacceptable accuracy for HemoSpec: "2g/dl accuracy is not sufficient for clinical use" "While 2g/dl accuracy in the field represents better accuracy than other low-cost methods such as HCS, it is not sufficient for clinical use"
3. Choukem <i>et al.</i> , 2020 <sup>8</sup>	URIT-12 Mission Hb	"Both overestimated mean Hb values" "Mission Hb failed to meet clinical accuracy requirements"

Study	POC Hb test(s) used	Challenges to POC Hb test use reported
4. Hawkes <i>et al.</i> , 2014 <sup>15</sup>	I-STAT	<p>“Sometimes a lack of cartridges or test strips at time of patient admission, repeated test failure due to elevated ambient temperature, problems with sample loading in cartridge, coagulation of whole-blood sample”</p> <p>“Sources of variability include cartridge transportation and storage conditions, practitioner technique and testing environment”</p> <p>“I-STAT Hb provided an unbiased estimate but LOAs indicate substantial variability in the measurement”</p>
5. McGann <i>et al.</i> , 2015 <sup>27</sup>	Novel POC colour-based assay	<p>“Color scale used for result interpretation included intervals of approx. 1.0g/dl Hb, which made it difficult to estimate the value to 0.1 or 0.2g/dl precision”</p> <p>Variability and subjectivity of result interpretation</p> <p>“An objective reading device such as a smartphone app would improve the variability and reduce the subjectivity of result interpretation”</p> <p>“For more reliable and broad implementation of this POC assay, a more precise means by which to determine the Hb concentration, such as an application software program with automatic scoring, will be necessary”</p> <p>“POC assay is also dependent upon specific volumes of both assay reagents and added blood” – uses collection tubes in this study</p> <p>“As the reaction is sensitive to the volume of blood collected, we utilised collection tubes of specific volumes and via capillary action”</p>
6. Nass <i>et al.</i> , 2020 <sup>29</sup>	Aptus and HemoCue 301	<p>Aptus:</p> <p>“Centrifugation process is sensitive to both significant vibrations and spatial orientation, which led to instances in which a measurement was not initiated or aborted”</p> <p>“Errors in sampling are only detected with photometry, which in majority of cases made it impossible to collect a second sample from the same participant – as already left clinic”</p>

Study	POC Hb test(s) used	Challenges to POC Hb test use reported
		<p>“Errors in capillary blood sampling most commonly occurred due to underfilling of the cuvette – many children distressed by finger-prick, making it difficult to produce a droplet and appropriately fill the Aptus cuvette with the resulting blood film formed on the finger”</p> <p>“Common error was overfilling cuvettes when venous blood was used on a plastic surface”</p> <p>“Longer duration of measurement and difficult in handling the cuvettes”</p> <p>“Both devices were shown to overestimate Hb concentration”</p> <p>“Wide limits of agreement in Bland-Altman plots – exceeds clinically acceptable inaccuracy of <math>\pm 1.0\text{g/dl}</math>”</p> <p>“Showed a relatively limited bias but large LOA”</p> <p>Cost:                      Hemocue 301: analyser £400, consumables £80 per 200 tests                      Aptus: analyser £250, consumables £60 per 200 tests</p>
7. Nkrumah <i>et al.</i> , 2011 <sup>30</sup>	HemoCue B-haemoglobin	“Presence of air bubbles, excess blood on the back of the microcuvettes, over filling of microcuvettes and insufficient mixing of the samples may lead to erroneous results”
8. Olatunya <i>et al.</i> , 2016 <sup>34</sup>	Mission Hb	<p>“Requires proper maintenance for it to function optimally”</p> <p>“Pass the device through quality control checks routinely”</p>
9. Olupot-Olupot <i>et al.</i> , 2019 <sup>35</sup>	HCS, HemoCue 301	<p>HemoCue 301:                      “Initial cost between 250-350 USD for the analyser (approx. 4 USD per test) – more expensive than Sahli’s method (initial 40-50 USD and 0.25 USD per test)”</p> <p>“Data suggests that in situations when HemoCue is unaffordable....”</p>
10. Parker <i>et al.</i> , 2018 <sup>38</sup>	HemoCue 201+ wicking and gravity method, Pronto DCI-mini	<p>“HemoCue wicking method and Pronto device were found to overestimate Hb concentration among anaemic children and underestimate Hb concentration among healthy children”</p> <p>“Possible user variability and blood sampling techniques of HemoCue wicking method”</p> <p>“HemoCue 201+ relatively high cost and limited availability of the disposable cuvettes”</p>

Study	POC Hb test(s) used	Challenges to POC Hb test use reported
		<p>“Effects of user variability and environmental factors such as heat and humidity”</p> <p>“Accuracy of Pronto is not clinically acceptable”</p> <p>“Results show a detection failure rate of 15%” (Pronto)</p>
<p>11. Ramaswamy <i>et al.</i>, 2021<sup>39</sup></p>	<p>HemoCue 301 and Rad-67 Spot check pulse co oximeter</p>	<p>“Several factors affect accuracy including geographic variations (altitude and temperature), procedural differences in capillary blood sample collection (intra and inter observer variations), study participant related factors (e.g. age, sex, biological determinants)”</p> <p>Rad-67:                      “Performance dependent on signal quality indicators such as motion, perfusion index quality and ambient light interference”                      “Was difficult to obtain stable indicators amongst children with continuous body movement”                      “Showed poor concordance with haematology analyser”                      “HemoCue and Rad-67 overestimated Hb value”</p> <p>Cost:                      HemoCue 301: “286 USD – approx. 0.41 USD per test”                      Rad-67: “1770 USD – approx. 0.68 USD per test – relatively high”                      Sahli’s: “13 USD – approx. 0.20 USD per test”</p>
<p>12. Smart <i>et al.</i>, 2017<sup>41</sup></p>	<p>Novel POC colour-based assay</p>	<p>“Challenge of reagent instability resulting in color drift away from the pre-printed color scale”</p> <p>“Only measures a maximum Hb concentration of 9.1g/dl”</p>
<p>13. Tack <i>et al.</i>, 2022<sup>42</sup></p>	<p>HemoCue 801</p>	<p>“Pronto/Rad-67 not ordered due to high cost (USD 1-2 per test)”</p> <p>“Difficulties in capillary blood sampling and transfer to microcuvettes caused unreliable Hb measurements at the start of the study”</p> <p>“Poor repeatability of Hb measurements (up to 2g/dl differences) was linked with subtle underfilling of the microcuvette and ‘milking’ of the finger during capillary blood sampling”</p> <p>“Device implementation required high investments (standard operating procedures, hands-on training workshops, supervised rotation, ‘device experts’”</p>

Study	POC Hb test(s) used	Challenges to POC Hb test use reported
		<p>“Order-of-draw of successive tests performed on capillary blood (order switched to take HemoCue sample before malaria rapid test to ensure 10µl aspiration – 3<sup>rd</sup> drop not always sufficient)”</p> <p>“A consistent point impacting affordability, delivery and access was the lack of an in-country distributor, which required logistics (stock management, international shipments), impacted work (calibration) and entailed additional costs”</p> <p>“Single-use consumables (microcuvettes) requiring disposal”</p> <p>“Difficult to fill microcuvette correctly/completely – if child moves, if blood drop is small, if blood drop is poorly delineated (particularly in severely anaemic children) – agitation complicated measurements by capillary blood sampling”</p> <p>“Massing finger or strong pressure on finger can disturb result”</p> <p>Maintenance:                      “Cleaning is a bit delicate and complicated: concentration needed to clean the interior part without leaving cotton particles – wait until all parts are dry before reassembling – sometimes difficult to reinsert the microcuvette support”                      “QC fluid is expensive and difficult to get and store due to cold chain requirements”</p>

POC = Point-of care. Hb = Haemoglobin. HCS = Haemoglobin Colour Scale. LOA = Limits of Agreement. USD = United States Dollar. QC = Quality Control. g/dl = grams per decilitre.

**Supplementary Table S4: Adapted QUADAS-2 Tool<sup>48</sup>**

**Phase 1: State the review question:**

<p><i>Patients (setting, intended use of index test, presentation, prior testing):</i></p> <p>Any children aged &lt;21 years attending health facilities in LMICs (clinics, hospitals, basic health units, medical practices etc.) for a POC Hb test to diagnose anaemia</p>
<p><i>Index test(s):</i></p> <p>Any POC(Hb)T (providing immediate results at site of care)</p>
<p><i>Reference standard and target condition:</i></p> <p>Any reference test used (other POC(Hb)T or non POC(Hb)T e.g., automated haematology analyser)</p> <p>Target condition: anaemia (all cause and severity)</p>

**Phase 2: Draw a flow diagram for the primary study**

**Phase 3: Risk of bias and applicability judgements**

Signalling questions were added to aid judgement of RoB for domain two: “Were methods for test conduct clearly described?” and domain three: “Was HemoCue used as reference test?”. The signalling question “Were the index test results interpreted without knowledge of results of reference standard?” was omitted for objective index tests.

**Domain 1: PATIENT SELECTION**

**A: Risk of Bias**

- Was a consecutive or random sample of patients enrolled? Yes/No/Unclear
- Was a case-control design avoided? Yes/No/Unclear
- Did the study avoid inappropriate exclusions? Yes/No/Unclear

Could the selection of patients have introduced bias? **RISK: LOW/HIGH/UNCLEAR**

**B: Concerns regarding applicability**

Is there concern that the included patients do not match the review question? **CONCERN: LOW/HIGH/UNCLEAR**

**Domain 2: INDEX TEST(S)**

If more than one index test was used, please complete for each test.

**A: Risk of Bias**

## Use of Point-of-care Haemoglobin Tests to Diagnose Childhood Anaemia in Low-and Middle-Income Countries: A Systematic Review

- Were the index test results interpreted without knowledge of the results of the reference standard? (omitted for objective index tests) Yes/No/Unclear
- If a threshold was used, was it reported or pre-specified? Yes/No/Unclear
- Were methods for test conduct clearly described? Yes/No/Unclear

Could the conduct or interpretation of the index test have introduced bias? **RISK: LOW/HIGH/UNCLEAR**

### **B: Concerns regarding applicability**

Is there concern that the index test, its conduct, or interpretation differ from the review question? **CONCERN: LOW/HIGH/UNCLEAR**

## **Domain 3: RERERENCE STANDARD**

### **A: Risk of Bias**

- Is the reference standard likely to correctly classify the target condition? Yes/No/Unclear
- Was HemoCue used as reference test? Yes/No/Unclear
- Were the reference standard results interpreted without knowledge of the results of the index test? Yes/No/Unclear

Could the reference standard, its conduct, or its interpretation have introduced bias? **RISK: LOW/HIGH/UNCLEAR**

### **B: Concerns regarding applicability**

Is there concern that the target condition as defined by the reference standard does not match the review question? **CONCERN: LOW/HIGH/UNCLEAR**

## **Domain 4: FLOW AND TIMING**

### **A: Risk of Bias**

- Was there an appropriate interval between index test(s) and reference standard? Yes/No/Unclear
- Did all patients receive a reference standard? Yes/No/Unclear
- Did patients receive the same reference standard? Yes/No/Unclear
- Were all patients included in the analysis? Yes/No/Unclear

Could the patient flow have introduced bias? **RISK: LOW/HIGH/UNCLEAR**

## **Supplementary Table S5: Blood Sample, Volume and Result Time Required for included POC(Hb)Ts**

POC Hb test	Blood sample and volume	Result time
<b>Invasive</b>		
<b>HemoCue 301</b> (Hemocue AB, Ängelholm, Sweden)	10µl capillary, venous or arterial	≤3 secs
<b>HemoCue 201+</b> (Hemocue AB, Ängelholm, Sweden)	10µl capillary, venous or arterial	15-60 secs
<b>HCS</b> (COPACK, Oststeinbek, Germany)	Drop of capillary or venous blood	30 secs
<b>Mission Hb</b> (ACON Laboratories, Inc., San Diego, USA)	10µl capillary or venous	≤15 secs
<b>URIT-12</b> (URIT Medical Electronics, Guangxi, China)	13-15µl capillary or venous	≤10 secs
<b>I-STAT</b> (Abbott, Abbott Park, IL)	65µl capillary, venous or arterial (EC8+)  95µl venous or arterial (CHEM8+)	120 secs
<b>HemoCue 201</b> (Hemocue AB, Ängelholm, Sweden)	10µl capillary, venous or arterial	15-60 secs
<b>Novel colour-based assay</b>	10µl capillary or venous	60 secs
<b>HemoCue 801</b> (Hemocue AB, Ängelholm, Sweden)	10µl capillary, venous or arterial	≤1 sec
<b>HemoCue B-haemoglobin</b> (Hemocue AB, Ängelholm, Sweden)	10µl capillary, venous or arterial	30-50 secs
<b>Aptus</b> (Entia, London, UK)	4-8µl Capillary or venous	≤60 secs
<b>HemoSpec</b>	10µl whole blood	Approx. 20 secs
<b>HemoControl</b> (EKF Diagnostics, Cardiff, UK)	8µl capillary, venous or arterial	25-60 secs

POC Hb test	Blood sample and volume	Result time
<b>Non-invasive</b>		
<b>Rad-67™ Pulse CO-Oximeter® and rainbow® DCI®-mini-Sensor</b> (Masimo Corporation, Irvine, USA)	Not required	30 secs
<b>Pronto® device with DCI-mini™ sensors</b> (Masimo Corporation, Irvine, USA)	Not required	40 secs

Hb = Haemoglobin. IL = Illinois. UK = United Kingdom. USA = United States of America. nm = Nanometre. µl = Microlitre. Secs = Seconds.

### Supplementary Figure S1. QUADAS-2 Risk of Bias and Applicability Concerns for Included Diagnostic Studies

Presented as percentage of studies with low, high, or unclear risk of bias and applicability concerns for each domain. Where studies tested two or more point-of-care haemoglobin tests (index tests), separate judgements were made for each domain.

**Supplementary Table S6: Justifications for Quality Assessment Judgements.**

Diagnostic study	Domain 1: Patient Selection		Domain 2: Index Test(s)		Domain 3: Reference Standard		Domain 4: Flow and Timing
	A: Risk of Bias	B: Concern	A: Risk of Bias	B: Concern	A: Risk of Bias	B: Concern	A: Risk of Bias
Aldridge <i>et al.</i> , 2012 <sup>4</sup>	Low 😊	Low 😊	Low 😊	Low 😊	High 😞	Low 😊	High 😞
	Consecutive sample, avoided case-control design and inappropriate exclusions (no refusals)	Patients and setting match review question	HCS performed before/without knowledge of reference standard. Training provided and threshold pre-specified (Hb<11g/dl and SA Hb<5g/dl). Methods for test conduct well described	POC Hb test, conduct, and interpretation match review question	HemoCue used as reference method. Literature is limited and variable on test accuracy in this population and setting	Target condition (anaemia) defined by reference test matches review question	11 patients excluded from final analysis due to incomplete set of data
Bond <i>et al.</i> , 2014 <sup>6</sup>	Unclear ?	Low 😊	Low 😊	Low 😊	High 😞	Low 😊	High 😞
	Unclear if a consecutive or random sample was enrolled	Patients and setting match review question	Methods for test conduct described. Threshold for anaemia not pre-specified but sensitivity/specificity data not reported (and therefore not applicable)	POC Hb test, conduct, and interpretation match review question	HemoCue 201+ used as reference method. Literature is limited and variable on test accuracy in this population and setting	Target condition (anaemia) defined by reference test matches review question	19 patients excluded from final analysis

	A: Risk of Bias	B: Concern	A: Risk of Bias	B: Concern	A: Risk of Bias	B: Concern	A: Risk of Bias
Parker <i>et al.</i> , 2018 <sup>38</sup> (HemoCue 201+)	Low 😊	Low 😊	Unclear ?	Low 😊	Low 😊	Low 😊	Low 😊
	Random sample, avoided case-control design and inappropriate exclusions	Patients and setting match review question	Threshold for anaemia (Hb<11.5g/dl) pre-specified but little information provided on test conduct	POC Hb test, conduct, and interpretation match review question	Reference test likely to correctly classify anaemia (laboratory haematology analyser)	Target condition (anaemia) defined by reference test matches review question	All patients included in final analysis for HemoCue, samples taken at same time and received same reference standard
Parker <i>et al.</i> , 2018 <sup>38</sup> (Pronto)	Low 😊	Low 😊	Unclear ?	Low 😊	Low 😊	Low 😊	High 😞
	Random sample, avoided case-control design and inappropriate exclusions	Patients and setting match review question	Threshold for anaemia (Hb<11.5g/dl) pre-specified but little information provided on test conduct	POC Hb test, conduct, and interpretation match review question	Reference test likely to correctly classify anaemia (laboratory haematology analyser)	Target condition (anaemia) defined by reference test matches review question	Only 112 of 132 children completed Pronto measurements and included in final analysis – could be due to patient factors such as SpO <sub>2</sub> resulting in detection failure and introducing bias

Diagnostic study	Domain 1: Patient Selection		Domain 2: Index Test(s)		Domain 3: Reference Standard		Domain 4: Flow and Timing
	A: Risk of Bias	B: Concern	A: Risk of Bias	B: Concern	A: Risk of Bias	B: Concern	A: Risk of Bias
Ramaswamy <i>et al.</i> , 2021 <sup>39</sup> (HemoCue 301)	High 😞	Low 😊	Unclear ?	Low 😊	Low 😊	Low 😊	Low 😊
	Consecutive sample but severely ill children were excluded – could introduce bias and lead to overestimation/underestimation of diagnostic accuracy	Patients and setting match review question	Threshold used for anaemia diagnosis not reported – could introduce bias if non-acceptable threshold used  (Methods for test conduct described)	POC Hb tests, conduct, and interpretation match review question	Reference test likely to correctly classify anaemia (laboratory haematology analyser)	Target condition (anaemia) defined by reference test matches review question	All patients enrolled were included in final analysis and received same reference standard. Blood samples were collected at same time with no interventions between tests
Ramaswamy <i>et al.</i> , 2021 <sup>39</sup> (Rad-67)	High 😞	Low 😊	Unclear ?	Low 😊	Low 😊	Low 😊	Low 😊
	Consecutive sample but severely ill children were excluded – could introduce bias and lead to overestimation/underestimation of diagnostic accuracy	Patients and setting match review question	Threshold used for anaemia diagnosis not reported – could introduce bias if non-acceptable threshold used.  (Methods for test conduct described)	POC Hb test, conduct, and interpretation match review question	Reference test likely to correctly classify anaemia (laboratory haematology analyser)	Target condition (anaemia) defined by reference test matches review question	All patients enrolled were included in final analysis and received same reference standard

Use of Point-of-care Haemoglobin Tests to Diagnose Childhood Anaemia in Low-and Middle-Income Countries: A Systematic Review

Diagnostic study	Domain 1: Patient Selection		Domain 2: Index Test(s)		Domain 3: Reference Standard		Domain 4: Flow and Timing
	A: Risk of Bias	B: Concern	A: Risk of Bias	B: Concern	A: Risk of Bias	B: Concern	A: Risk of Bias
Smart <i>et al.</i> , 2017 <sup>41</sup>	Unclear ?	Low 😊	Low 😊	Low 😊	Low 😊	Low 😊	High 😞
	Unclear if a consecutive or random sample was enrolled or if inappropriate exclusions were avoided	Patients and setting match review question	Observers were blinded and training provided (although minimal). Acceptable threshold for SA used (Hb≤7g/dl and very SA Hb≤5g/dl). Methods for test conduct well described.	POC assay, conduct, and interpretation match review question	Reference test likely to correctly classify anaemia (laboratory haematology analyser)	Target condition (anaemia) defined by reference test matches review question	Not all patients included in final analysis and not all patients received a reference standard
Ughasoro <i>et al.</i> , 2019 <sup>45</sup>	Low 😊	Low 😊	Low 😊	Low 😊	High 😞	Low 😊	High 😞
	Random sample, case-control design avoided and no exclusion criteria – randomly selected households with children <10 years	Patients and setting match review question – selected households invited to health facility for Hb measurement	Training was provided on use of HCS, results were interpreted independently/before reference method and threshold was pre-specified (Hb<11g/dl). Methods for test conduct well described.	POC Hb test, conduct, and interpretation match review question	HemoCue 301 used as reference method. Literature is limited and variable on test accuracy in this population and setting	Target condition (anaemia) defined by reference test matches review question	573 children enrolled but only 524 included in final analysis and no explanation for this. Exact time interval between index and reference test not reported

POC = Point-of care. HCS = Haemoglobin Colour Scale. Hb = Haemoglobin. SA = Severe anaemia. QC = Quality control. SCD = Sick cell disease. SpO<sub>2</sub> = Oxygen saturation.
