

Supplemental Figure 3

Supplemental Figure 3. Ab titers and plasmablast responses

A-B. SARS-CoV-2-specific Ab titers were assessed for COVID-19 patients and healthy volunteers using Multiplex Bead Binding Assay (MBBA). IgG anti-Spike responses are shown in **(A)**, anti-NC responses in **(B)**. COVID-19 patient samples are split by days post-onset (DPO) of symptoms into acute (≤ 10 DPO) and convalescent (> 10 DPO). For the vaccine group, samples collected 4 weeks post-first vaccine dose were used. P-value were determined by Welch's t-test (* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$).

C. Spike-specific Ab titers for 3 healthy volunteers before and after receiving the BNT162b2 mRNA vaccine and booster, assessed by direct ELISA.
