³ Canadian Center for Vaccinology, IWK Health Centre and Nova Scotia Health Authority, Dalhousie University, Halifax, Nova Scotia, Canada

This Supplemental provides additional information for parameterisation of the model, additional figures supporting results reported in the main text, and the results of secondary analyses with willingness-to-pay thresholds of \$30,000 and \$70,000.

1. Model scenarios and inputs

Scenarios evaluated in the model are summarised in Table A1 below:

Table A1. Immunisation programs, target populations, and immunisation coverages.

Immunisation Program	Target population	Immunisation coverage	
		Basecase analysis	Secondary analysis
L1	Infants ≤ 32 wGA, and infants with CLD or CHD	100%	80%
L2	Infants ≤ 36 wGA, and infants with CLD or CHD	100%	80%
L3	Infants ≤ 36 wGA, and infants with CLD or CHD, and infants ≥ 37 wGA born during the RSV season	100%	80%

L3	Entire birth cohort	100%	80%
MI	Pregnant women	100%	60%
LMI	Infants ≤ 32 wGA, and infants with CLD or CHD	100%	80%
	pregnant women	100%	60%

The birth cohort included 1113 infants with approximately 93 births per month, of which ~2% were born at less than 33 wGA and ~6% were preterm of 33-35 wGA. The population size of infants targeted in L1, L2, L3, and L4 were 38, 104, 582, and 1113 per 100,000 population.

Figure A1. Seasonal distribution of MA-RSV LRTI for infants under 1 year of age. To generate the distribution, we considered the estimated medically attended RSV infection, on a monthly basis, for 9 seasons from 2010-11 to 2018-2019.¹ Applying the rates of MA RSV reported for infants under 1 year of age (Table A2), monthly distribution of MA RSV LRTI for different age groups among infants was generated by averaging each month over the 9 seasons.

Table A2. Rates of MA RSV LRTI among infants under 1 year of age.¹ Rates were derived from previously published study, estimating the rate of MA RSV among all age groups in the population (Table 1 in Ref. 1).

Age	Rate
< 29 days	5.1%
29–89 days	14.7%

90 days to < 6 months	11.12%
6 months to < 1 year	11.9%

Figure A2. Hospitalisation rates of MA RSV LRT infants based on wGA and age at incidence derived from previously published studies.^{2,3} The range of rates are reported in Table A3.

Table A3. Hospitalisation rates (%) by wGA and age at incidence.

wGA	Age at incidence (months)											
	0	1	2	3	4	5	6	7	8	9	10	11
≥33												
Low	1.76	3.11	2.22	1.56	1.35	0.82	0.70	0.79	0.59	0.65	0.59	0.49
High	2.28	4.37	2.42	1.74	1.50	1.08	0.96	0.95	0.72	0.84	0.63	0.59
mean	2.02	3.74	2.32	1.65	1.425	0.95	0.83	0.87	0.655	0.745	0.61	0.54
29-32												
Low	3.52	6.22	4.44	3.12	2.70	1.64	1.40	1.58	1.18	1.30	1.18	0.98
High	4.56	8.74	4.84	3.48	3.00	2.16	1.92	1.90	1.44	1.68	1.26	1.18
mean	4.04	7.48	4.64	3.3	2.85	1.9	1.66	1.74	1.31	1.49	1.22	1.08
<29												
Low	5.28	9.33	6.66	4.68	4.05	2.46	2.10	2.37	1.77	1.95	1.77	1.47

High	6.84	13.11	7.26	5.22	4.50	3.24	2.88	2.85	2.16	2.52	1.89	1.77
mean	6.06	11.22	6.96	4.95	4.275	2.85	2.49	2.61	1.965	2.235	1.83	1.62

The probability of hospitalisation (p_c) for infants with CLD or CHD condition was determined by

$$p_c(a) = \frac{p_0(a)L}{1 + p_0(a)L - p_0(a)},$$

where $p_0(a)$ is the probability of hospitalisation for infants without CLD or CHD at age a in months (Table A3), and L is the likelihood of hospitalisation for infants with CLD or CHD compared to those without these conditions.^{4,5}

Figure A3. Timelines of immunisation. Nirsevimab is offered at birth to infants born during RSV season from the start of October to the end of March. Those who are born off-season are immunised with nirsevimab at the start of season in October. Maternal immunisation is offered to pregnant women year-round, during the third trimester before gestation week 33.

2. Temporal decline of efficacy

To parameterize the model with temporal efficacy of nirsevimab and RSVpreF, we considered a sigmoidal decay function over a 10-month period, given by

$$V_e(t) = VE_{\max} - \frac{(VE_{\max} - VE_{\min})a}{b + e^{-ct}}$$

where VE_{mean} is the mean efficacy estimated during the follow-up period post vaccination, VE_{\max} and VE_{\min} are the maximum and minimum efficacy estimates during the study period. Assuming that the vaccine efficacy reduced to zero at 10 months after vaccination,⁶ we estimated the parameters $a > 0$, $b > 0$, and $c > 0$ (using curve fitting function in Matlab) to derive estimates with the same average residual protections as reported in clinical trials for the first 5 months post immunisation. Figure A4 (A,B) illustrates the decline of protection efficacy over a 10-month period post-dose for different outcomes.

We also considered constant vaccine efficacy profiles for each outcome with the mean

estimates reported in clinical trials over the study period, followed by a linear decline to a zero protection at 10 months after immunisation (Figure A4, C-D).

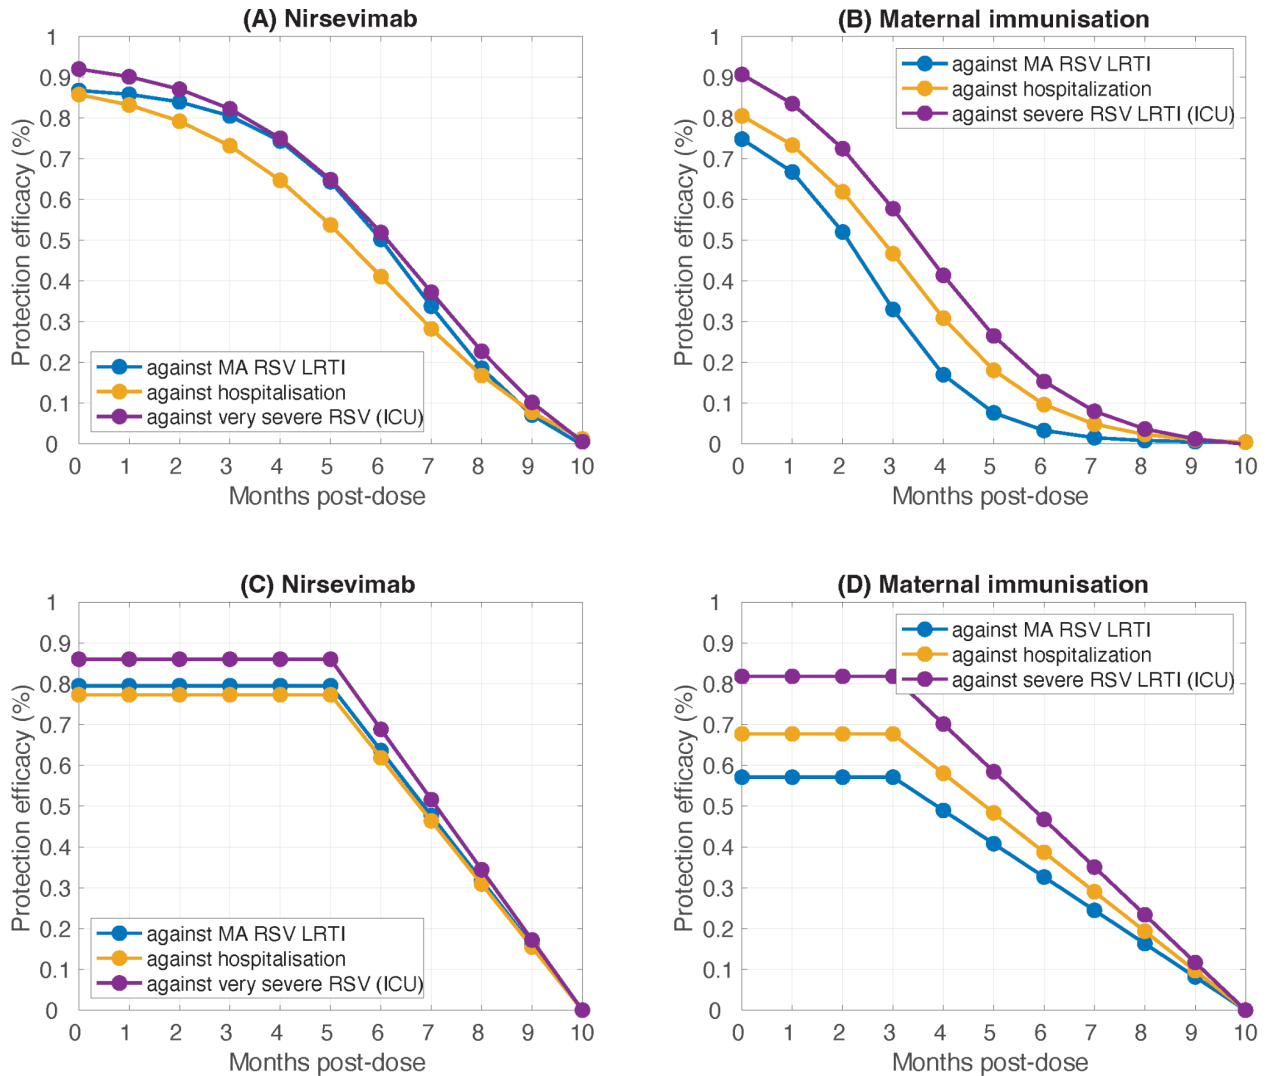

Figure A4. Vaccine efficacy profiles. Panel (A) and (B) correspond to sigmoidal decay of protection for each outcome after a single dose of nirsevimab and RSVpreF, respectively. Panel (C) and (D) correspond to constant protection efficacy followed by a linear decline to zero after a single dose of nirsevimab and RSVpreF, respectively.

3. Reduction of direct and indirect costs

Table A4. Reduction of direct (outpatient and inpatient) costs and indirect costs using intervention scenarios evaluated with 100% coverage of nirsevimab and 100% coverage of maternal vaccination, compared to no intervention.

Intervention	Reduction of costs (%)		
	Outpatient (95% CI)	Inpatient (95% CI)	indirect (95% CI)
<i>Sigmoidal vaccine efficacy profiles</i>			
L1	2.40 (2.36 to 2.44)	11.24 (10.36 to 12.11)	2.80 (2.73 to 2.87)
L2	6.31 (6.25 to 6.38)	16.86 (15.96 to 17.74)	6.73 (6.64 to 6.83)
L3	41.30 (41.20 to 41.42)	63.21 (62.17 to 64.25)	41.29 (41.18 to 41.42)
L4	64.73 (64.58 to 64.90)	79.93 (79.04 to 80.78)	64.99 (64.82 to 65.15)
MI	38.13 (37.98 to 38.28)	76.13 (75.23 to 76.95)	38.05 (37.89 to 38.21)
LMI	39.26 (39.11 to 39.41)	78.11 (77.28 to 78.91)	39.28 (39.13 to 39.45)
<i>Constant vaccine efficacy profiles</i>			
L1	2.37 (2.33 to 2.41)	11.21 (10.30 to 12.03)	2.77 (2.70 to 2.84)
L2	6.21 (6.14 to 6.28)	16.87 (15.90 to 17.75)	6.63 (6.54 to 6.72)
L3	40.52 (40.42 to 40.63)	63.12 (62.07 to 64.12)	40.55 (40.44 to 40.69)
L4	63.66 (63.53 to 63.80)	79.83 (78.91 to 80.64)	63.97 (63.82 to 64.12)
MI	45.93 (45.78 to 46.09)	84.24 (83.47 to 84.88)	46.23 (46.07 to 46.39)
LMI	46.75 (46.61 to 46.91)	85.10 (84.38 to 85.75)	47.09 (46.94 to 47.26)

Table A5. Reduction of direct (outpatient and inpatient) costs and indirect costs using intervention scenarios evaluated with 80% coverage of nirsevimab and 60% coverage of maternal vaccination, compared to no intervention.

Intervention	Reduction of costs (%)		
	Outpatient (95% CI)	Inpatient (95% CI)	indirect (95% CI)
<i>Sigmoidal vaccine efficacy profiles</i>			
L1	1.92 (1.88 to 1.95)	9.01 (8.19 to 9.72)	2.25 (2.18 to 2.31)
L2	5.06 (5.00 to 5.12)	13.70 (12.83 to 14.57)	5.42 (5.33 to 5.50)
L3	33.03 (32.92 to 33.14)	50.63 (49.61 to 51.73)	33.03 (32.90 to 33.14)
L4	51.80 (51.64 to 51.94)	63.80 (62.76 to 64.87)	52.00 (51.84 to 52.15)
MI	22.83 (22.70 to 22.95)	45.43 (44.33 to 46.54)	22.83 (22.70 to 22.98)
LMI	24.15 (24.02 to 24.27)	49.90 (48.83 to 50.96)	24.32 (24.18 to 24.45)
<i>Constant vaccine efficacy profiles</i>			
L1	1.89 (1.85 to 1.93)	8.97 (8.18 to 9.71)	2.22 (2.15 to 2.28)
L2	4.98 (4.92 to 5.04)	13.64 (12.78 to 14.50)	5.34 (5.26 to 5.43)
L3	32.41 (32.30 to 32.52)	50.51 (49.45 to 51.58)	32.43 (32.31 to 32.54)
L4	50.94 (50.79 to 51.07)	63.72 (62.66 to 64.72)	51.18 (51.03 to 51.32)
MI	27.51 (27.38 to 27.65)	50.02 (48.93 to 51.07)	27.73 (27.58 to 27.88)
LMI	28.67 (28.55 to 28.81)	54.07 (52.96 to 55.10)	29.04 (28.89 to 29.18)

4. Secondary analyses with a WTP of \$50,000 per QALY gained

4.1. 100% coverage of nirsevimab and 100% coverage of maternal vaccination

Table A6. Reduction of RSV-related outcomes (%) in intervention programs compared to no intervention with 100% coverage of nirsevimab and 100% coverage of maternal vaccination, corresponding to Figure 2 of the main text.

Intervention	Outpatient (95% CI)	Inpatient (95% CI)	Death (95% CI)
<i>Sigmoidal vaccine efficacy profiles</i>			
L1	2.0 (2.0 to 2.1)	6.2 (5.8 to 6.6)	24.3 (16.0 to 33.2)
L2	5.9 (5.8 to 5.9)	11.1 (10.6 to 11.6)	36.3 (26.8 to 46.5)
L3	38.9 (38.8 to 39.0)	61.2 (60.4 to 62.1)	67.9 (58.8 to 77.3)
L4	63.4 (63.2 to 63.5)	79.3 (78.7 to 80.1)	77.8 (69.6 to 82.3)
MI	34.0 (33.9 to 34.2)	72.8 (72.1 to 73.5)	72.4 (62.5 to 81.9)
LMI	35.2 (35.0 to 35.3)	74.2 (73.5 to 74.9)	76.8 (67.1 to 85.8)
<i>Constant vaccine efficacy profiles</i>			
L1	2.0 (2.0 to 2.0)	6.1 (5.7 to 6.6)	24.3 (16.0 to 33.2)
L2	5.8 (5.7 to 5.8)	11.0 (10.5 to 11.6)	36.3 (26.8 to 46.5)
L3	38.1 (38.0 to 38.2)	60.8 (60.0 to 61.7)	67.9 (58.4 to 77.4)
L4	62.3 (62.1 to 62.4)	78.9 (78.2 to 79.6)	77.9 (69.3 to 85.4)
MI	42.3 (42.1 to 42.4)	80.6 (80.0 to 81.2)	80.1 (71.4 to 88.9)
LMI	43.1 (43.0 to 43.3)	81.3 (80.6 to 81.9)	82.3 (74.0 to 90.2)

The results in this section include the monetary loss of life as an indirect cost in the cost-effectiveness analysis from a societal perspective.

Figure A5. Estimated net monetary benefit (NMB) as a function of price per dose at the WTP threshold of \$50,000 per QALY gained with the inclusion of monetary loss of life due to RSV-related infant mortality. Panels (A) and (B) correspond to the analysis from a societal perspective using sigmoidal and constant vaccine efficacy profiles, respectively. Note that the inclusion of monetary loss due to infant mortality (as an indirect cost) does not affect cost-effectiveness analysis from a healthcare perspective.

Table A7. Model estimates of cost-effectiveness analyses associated with infant and maternal immunisation programs as standalone prevention strategies from a societal perspective at the WTP of \$50,000 per QALY gained. All strategies were compared to the baseline with no intervention, and with the inclusion of monetary loss of life due to RSV-related infant mortality. Since the monetary loss of life, as an indirect cost, does not affect cost-effectiveness from a healthcare perspective, the results of Table 3 and 4 of the main text are applicable for the healthcare perspective.

Prevention strategy	Maximum PPD, \$	Incremental costs, \$ (95% CI)	QALYs gained (95% CI)	ICER, \$/QALY (95% CI)	Probability of being cost-effective	Budget impact per 100,000 population, \$
<i>Societal perspective, sigmoidal vaccine efficacy profiles</i>						
L1	1,000	-38,282 (-60,190 to -17,798)	1.023 (0.607 to 1.479)	-37,439 (-41,487 to -28,904)	Cost-saving	15,688
L2	1,000	-17,393 (-44,625 to 7,446)	1.533 (1.025 to 2.083)	-11,345 (-21,523 to 7,164)	100%	66,571
L3	870	142,571 (107,290 to 176,328)	2.904 (2.256 to 3.595)	49,091 (29,780 to 78,778)	52%	334,811
L4	580	165,298 (126,772 to 201,367)	3.324 (2.635 to 4.065)	49,721 (31,088 to 76,585)	50%	406,748
MI	470	151,898 (113,226 to 188,026)	3.101 (2.406 to 3.882)	48,980 (29,229 to 78,462)	52%	349,576
<i>Societal perspective, constant vaccine efficacy profiles</i>						
L1	1,000	-38,129 (-60,033 to -17,630)	1.022 (0.607 to 1.479)	-37,291 (-41,376 to -28,707)	Cost-saving	15,795
L2	1,000	-17,089 (-44,330 to 7,796)	1.533 (1.025 to 2.083)	-11,147 (-21,381 to 7,553)	100%	66,752

L3	865	143,040 (107,283 to 176,698)	2.895 (2.212 to 3.595)	49,406 (29,797 to 79,337)	52%	333,862

Figure A9. Net monetary benefit (NMB) of the combined infant and maternal immunisation program at the WTP of \$50,000 per QALY gained as a function of PPD for nirsevimab and RSVpreF. Panels (A) and (B) correspond to the analysis from healthcare and societal perspectives, respectively, with sigmoidal vaccine efficacy profiles. Panels (C) and (D) correspond to the analysis from the healthcare and societal perspectives, respectively, with constant vaccine efficacy profiles. Red circles correspond to the PPD values in Tables A12 and A13.

4.2.2. Cost-effectiveness analysis with monetary loss of life

Cost-effectiveness analyses in this section include the monetary loss of life as an indirect cost from a societal perspective. Reductions of RSV-related outcomes remain the same as reported in Figure A7 and Table A6.

Figure A10. Estimated net monetary benefit (NMB) as a function of price per dose at the WTP threshold of \$50,000 per QALY gained with the inclusion of monetary loss of life due to RSV-related infant mortality. Panels (A) and (B) correspond to the analysis from a societal perspective using sigmoidal and constant vaccine efficacy profiles, respectively. Note that the inclusion of monetary loss due to infant mortality (as an indirect cost) does not affect cost-effectiveness analysis from a healthcare perspective.

Table A14. Model estimates of cost-effectiveness analyses associated with infant and maternal immunisation programs as standalone prevention strategies from a societal perspective at the WTP of \$50,000 per QALY gained. All strategies were compared to the baseline with no intervention with the inclusion of monetary loss of life due to RSV-related infant mortality. Since the monetary loss of life, as an indirect cost, does not affect cost-effectiveness from a healthcare perspective, the results of Table A10 and A11 are applicable for the healthcare perspective.

Prevention strategy	Maximum PPD, \$	Incremental costs, \$ (95% CI)	QALYs gained (95% CI)	ICER, \$/QALY (95% CI)	Probability of being cost-effective	Budget impact per 100,000 population, \$

Table A21. Model estimates of cost-effectiveness analyses associated with the combined infant and maternal immunisation program from a societal perspective at the WTP of \$30,000 per QALY gained. All strategies were compared to the baseline with no intervention, and with the inclusion of monetary loss of life due to RSV-related infant mortality. Since the monetary loss of life, as an indirect cost, does not affect cost-effectiveness from a healthcare perspective, the results of Table A18 and A19 of the previous section are applicable for the healthcare perspective.

Nirsevimab PPD, \$	RSVpreF PPD, \$	Incremental costs, \$ (95% CI)	QALYs gained (95% CI)	ICER, \$/QALY (95% CI)	Probability of being cost-effective	Budget impact per 100,000 population, \$

Figure A21. Net monetary benefit (NMB) of the combined infant and maternal immunisation program at the WTP of \$70,000 per QALY gained as a function of PPD for nirsevimab and RSVpreF. Panels (A) and (B) correspond to the analysis from healthcare and societal perspectives, respectively, with sigmoidal vaccine efficacy profiles. Panels (C) and (D) correspond to the analysis from the healthcare and societal perspectives, respectively, with constant vaccine efficacy profiles. Red circles correspond to the PPD values in Tables A30 and A31.

6.1.2. Cost-effectiveness analysis with monetary loss of life

Figure A22. Estimated net monetary benefit (NMB) as a function of price per dose at the WTP threshold of \$70,000 per QALY gained with the inclusion of monetary loss of life due to RSV-related infant mortality. Panels (A) and (B) correspond to the analysis from a societal perspective using sigmoidal and constant vaccine efficacy profiles, respectively. Note that the inclusion of monetary loss due to infant mortality (as an indirect cost) does not affect cost-effectiveness analysis from a healthcare perspective.

Table A32. Model estimates of cost-effectiveness analyses associated with LAMA and maternal immunisation programs as standalone prevention strategies from a societal perspective at the WTP of \$70,000 per QALY gained. All strategies were compared to the baseline with no intervention, and with the inclusion of monetary loss of life due to RSV-related infant mortality. Since the monetary loss of life, as an indirect cost, does not affect cost-effectiveness from a healthcare perspective, the results of Table A28 and A29 are applicable for the healthcare perspective.

Prevention strategy	Maximum PPD, \$	Incremental costs, \$ (95% CI)	QALYs gained (95% CI)	ICER, \$/QALY (95% CI)	Probability of being cost-effective	Budget impact per 100,000 population, \$

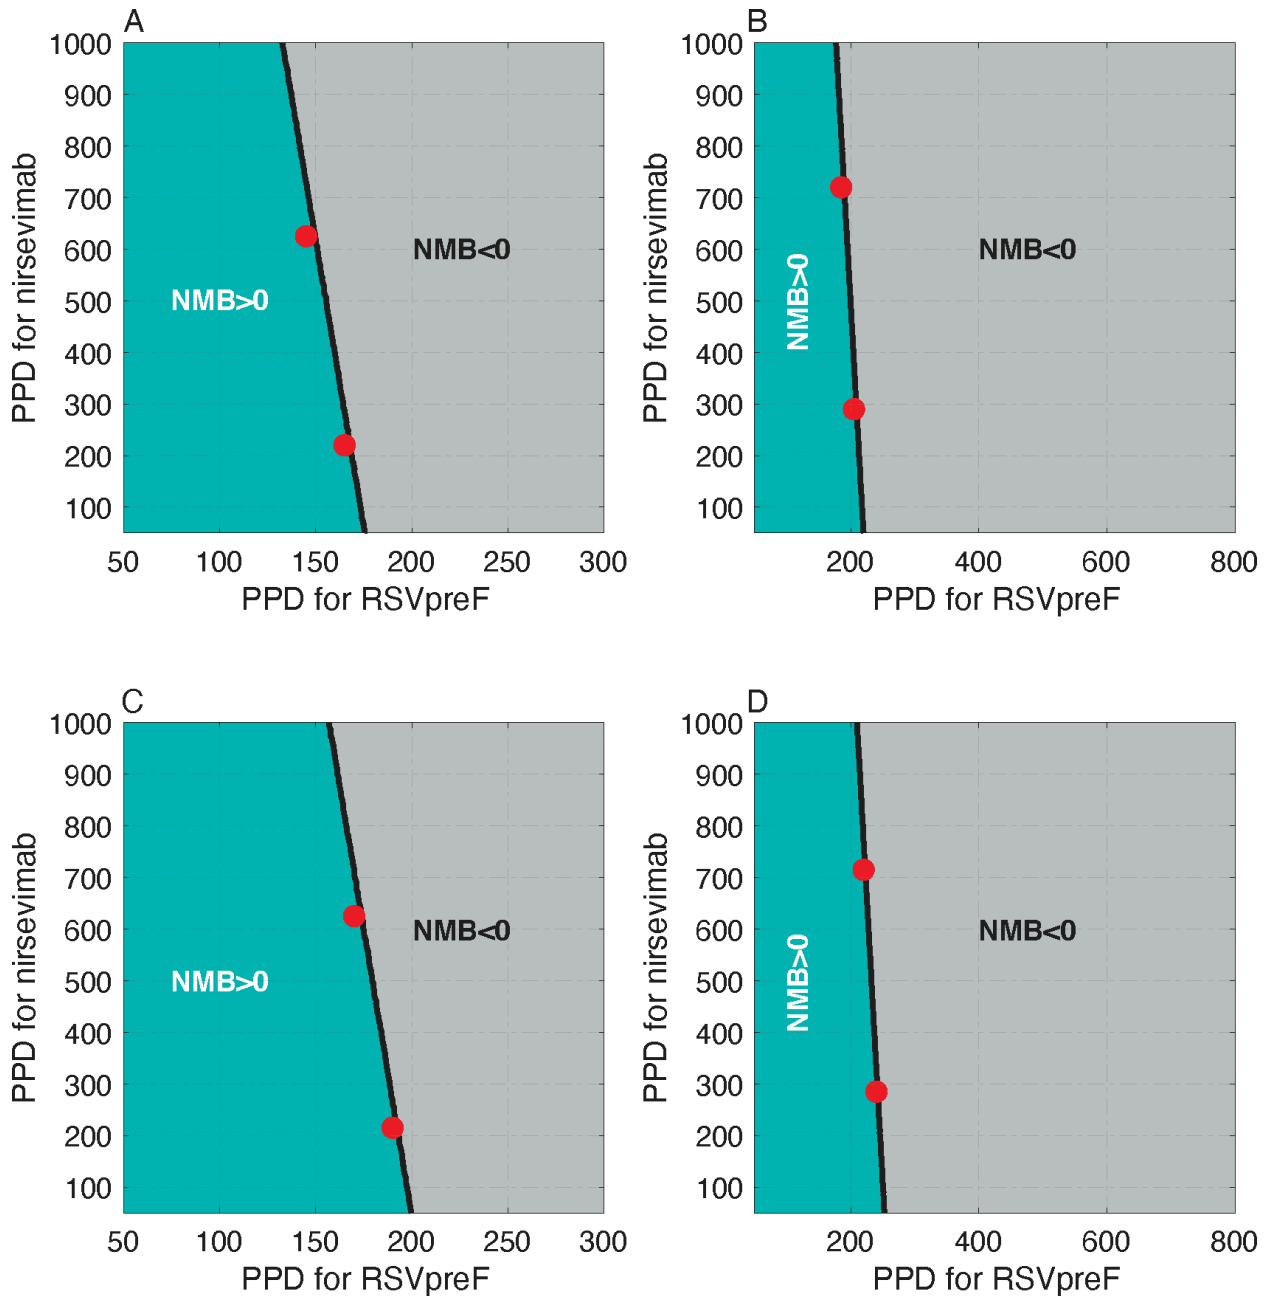

Figure A25. Net monetary benefit (NMB) of the combined infant and maternal immunisation program at the WTP of \$70,000 per QALY gained as a function of PPD for nirsevimab and RSVpreF. Panels (A) and (B) correspond to the analysis from healthcare and societal perspectives, respectively, with sigmoidal vaccine efficacy profiles. Panels (C) and (D) correspond to the analysis from the healthcare and societal perspectives, respectively, with constant vaccine efficacy profiles. Red circles correspond to the PPD values in Tables A36 and A37.

6.2.2. Cost-effectiveness analysis with monetary loss of life

Figure A26. Estimated net monetary benefit (NMB) as a function of price per dose at the WTP threshold of \$70,000 per QALY gained with the inclusion of monetary loss of life due to RSV-related infant mortality. Panels (A) and (B) correspond to the analysis from a societal perspective using sigmoidal and constant vaccine efficacy profiles, respectively. Note that the inclusion of monetary loss due to infant mortality (as an indirect cost) does not affect cost-effectiveness analysis from a healthcare perspective.

Table A38. Model estimates of cost-effectiveness analyses associated with infant and maternal immunisation programs as standalone prevention strategies from a societal perspective at the WTP of \$70,000 per QALY gained. All strategies were compared to the baseline with no intervention with the inclusion of monetary loss of life due to RSV-related infant mortality. Since the monetary loss of life, as an indirect cost, does not affect cost-effectiveness from a healthcare perspective, the results of Table A34 and A35 are applicable for the healthcare perspective.

Prevention strategy	Maximum PPD, \$	Incremental costs, \$ (95% CI)	QALYs gained (95% CI)	ICER, \$/QALY (95% CI)	Probability of being cost-effective	Budget impact per 100,000 population, \$

L4	660	196,973 (162,364 to 231,073)	2.856 (2.186 to 3.545)	68,972 (45,842 to 105,412)	52%	398,960
MI	620	151,336 (119,116 to 181,867)	2.203 (1.602 to 2.849)	68,775 (42,031 to 113,753)	52%	275,920

Table A39. Model estimates of cost-effectiveness analyses associated with the combined infant and maternal immunisation program from a societal perspective at the WTP of \$70,000 per QALY gained. All strategies were compared to the baseline with no intervention with the inclusion of monetary loss of life due to RSV-related infant mortality. Since the monetary loss of life, as an indirect cost, does not affect cost-effectiveness from a healthcare perspective, the results of Table A36 and A37 are applicable for the healthcare perspective.

Nirsevimab PPD, \$	RSVpreF PPD, \$	Incremental costs, \$ (95% CI)	QALYs gained (95% CI)	ICER, \$/QALY (95% CI)	Probability of being cost-effective	Budget impact per 100,000 population, \$
<i>Societal perspective, sigmoidal vaccine efficacy profiles</i>						
1,000	565	153,896 (121,674 to 183,664)	2.255 (1.650 to 2.895)	68,260 (42,156 to 111,078)	53%	293,734
660	585	157255 124816 187622	2.255 (1.650 to 2.895)	69887 43093 113721	49%	296,861
<i>Societal perspective, constant vaccine efficacy profiles</i>						
1,000	635	170,187 (136,513 to 200,934)	2.438 (1.835 to 3.126)	69,916 (44,134 to 109,821)	50%	324,601
660	650	169,798 (135,507 to 200,892)	2.438 (1.835 to 3.126)	69,645 (43,335 to 110,023)	50%	324,391

Figure A27. Net monetary benefit (NMB) of the combined infant and maternal immunisation program at the WTP of \$70,000 per QALY gained as a function of PPD for nirsevimab and RSVpreF. Panels (A) and (B) correspond to the analysis from a societal perspective with sigmoidal and constant vaccine efficacy profiles, respectively. Red circles correspond to the PPD values in Table A39.

7. Cost-effectiveness planes for immunisation programs with the WTP of \$50,000 per QALY gained

7.1. 100% coverage of nirsevimab and 100% coverage of maternal vaccination without monetary loss of life

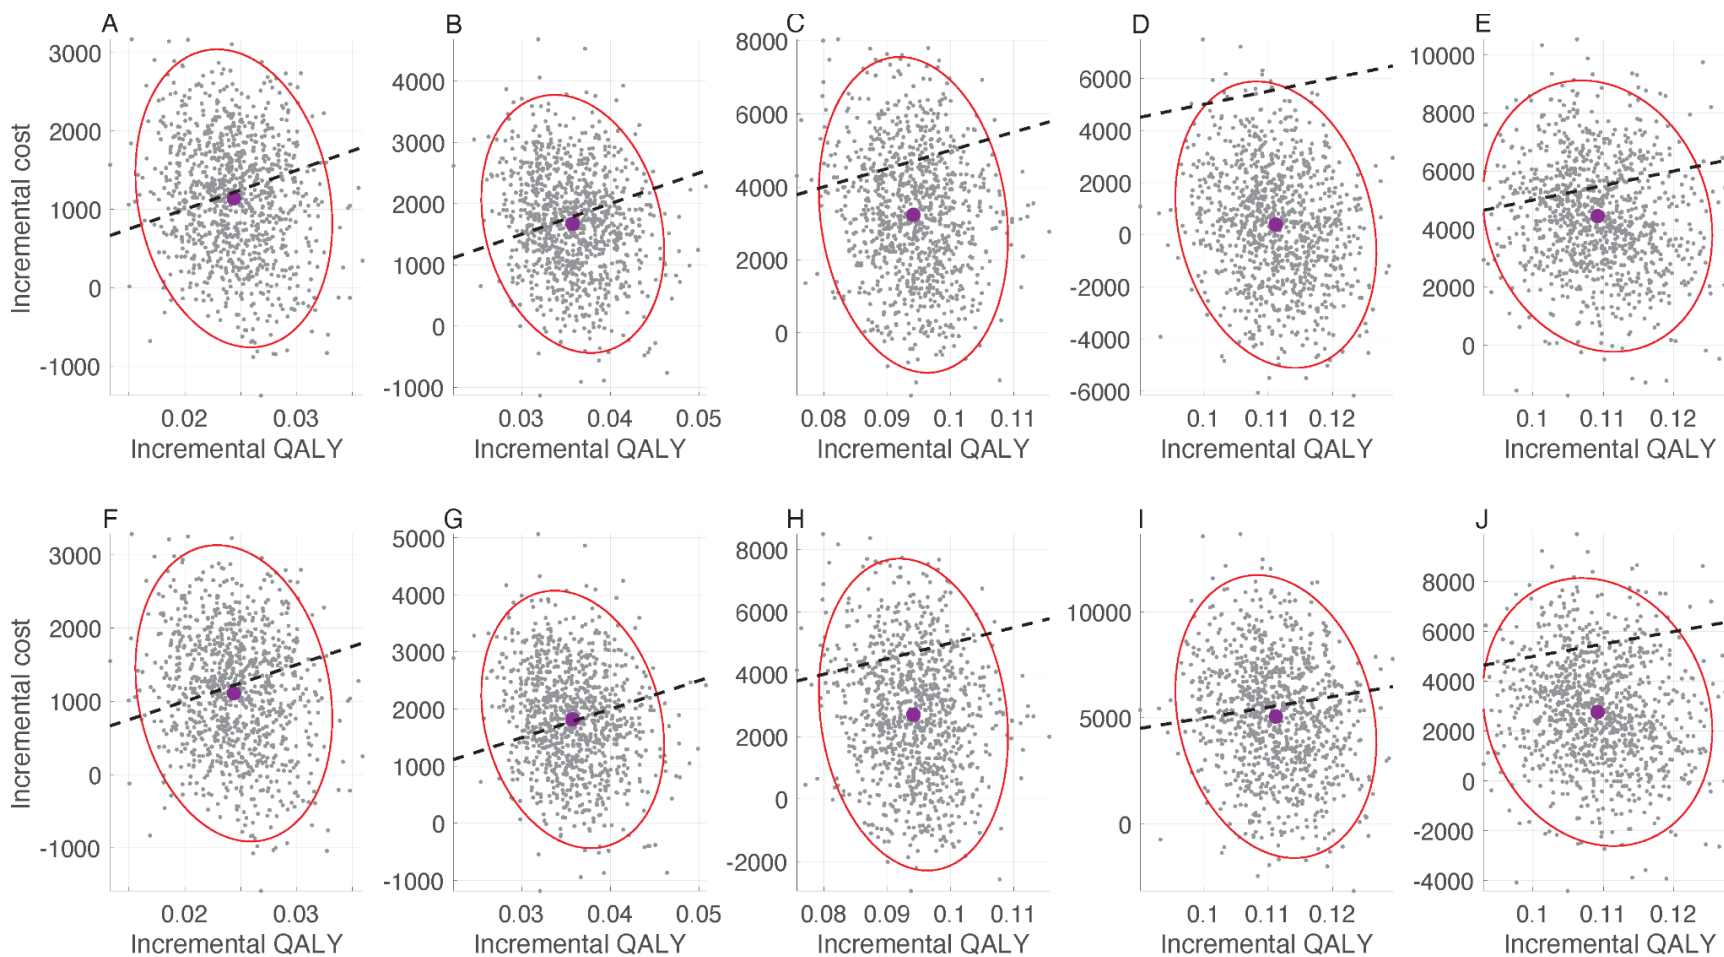

Figure A28. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from healthcare (A,B,C,D,E) and societal (F,G,H,I,J) perspectives using sigmoidal vaccine efficacy profiles. The maximum PPD for

nirsevimab and RSVpreF correspond to estimates reported in Table 3 of the main text. Black dashed-line corresponds to the WTP threshold of \$50,000 per QALY gained.

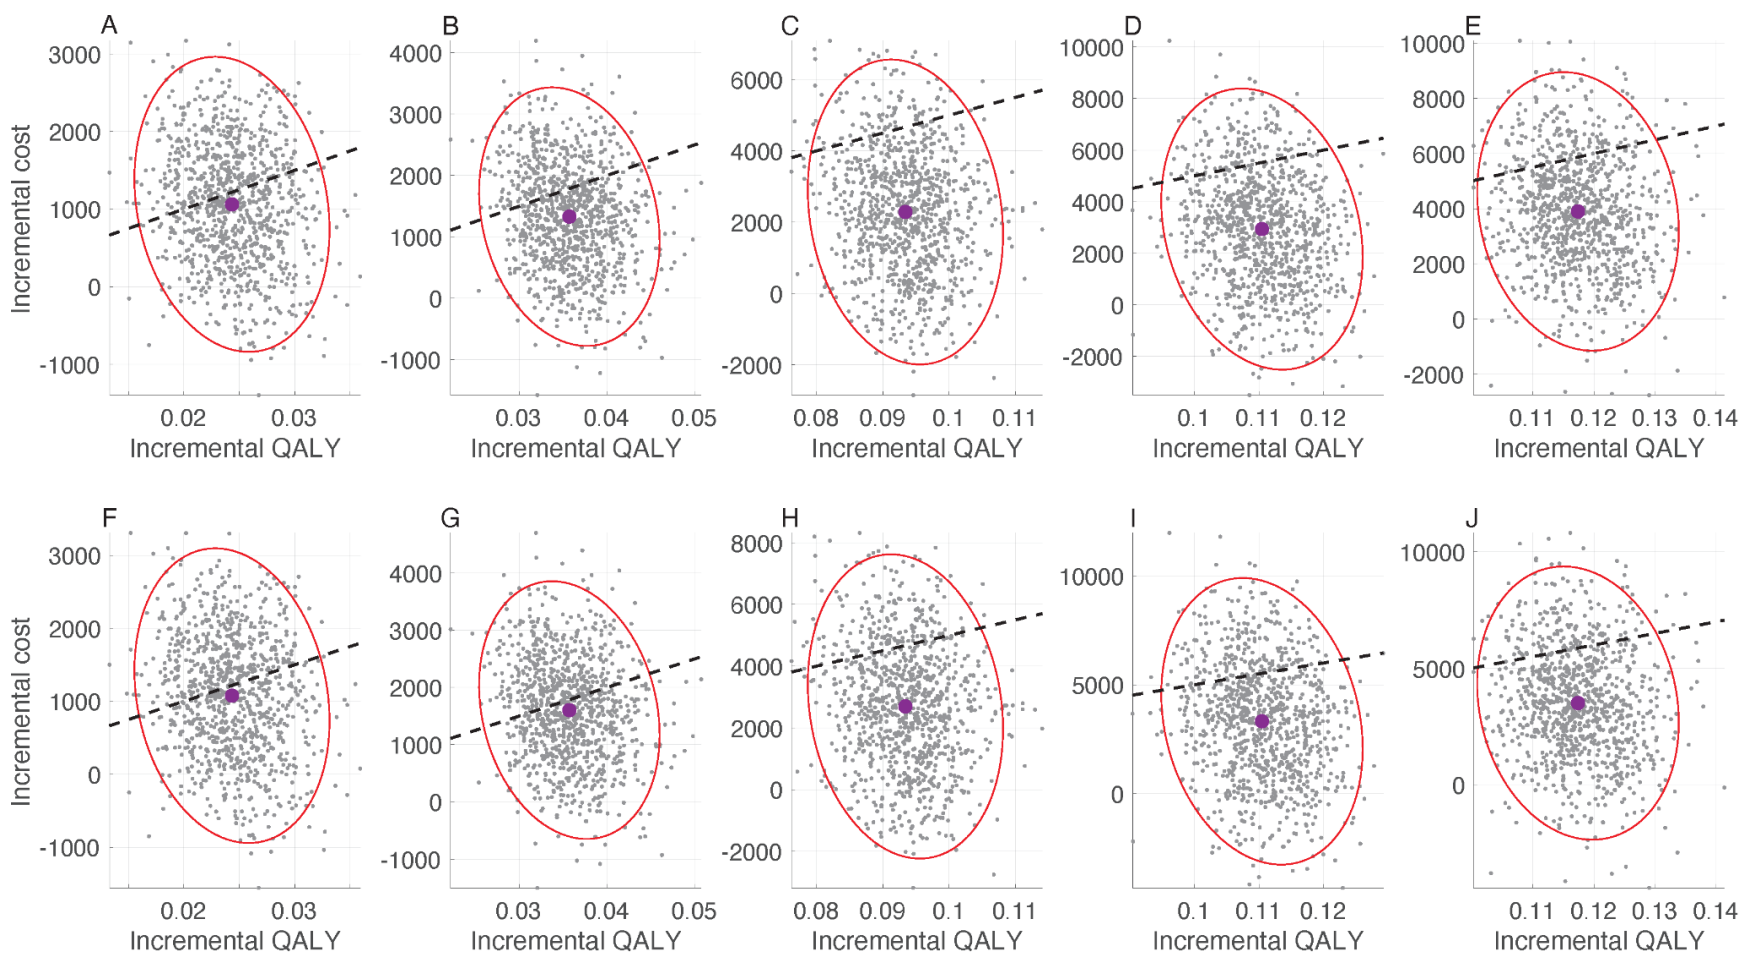

Figure A29. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from healthcare (A,B,C,D,E) and societal (F,G,H,I,J) perspectives using constant vaccine efficacy profiles. The maximum PPD for nirsevimab and RSVpreF correspond to estimates reported in Table 4 of the main text. Black dashed-line corresponds to the WTP threshold of \$50,000 per QALY gained.

7.2. 100% coverage of nirsevimab and 100% coverage of maternal vaccination with monetary loss of life

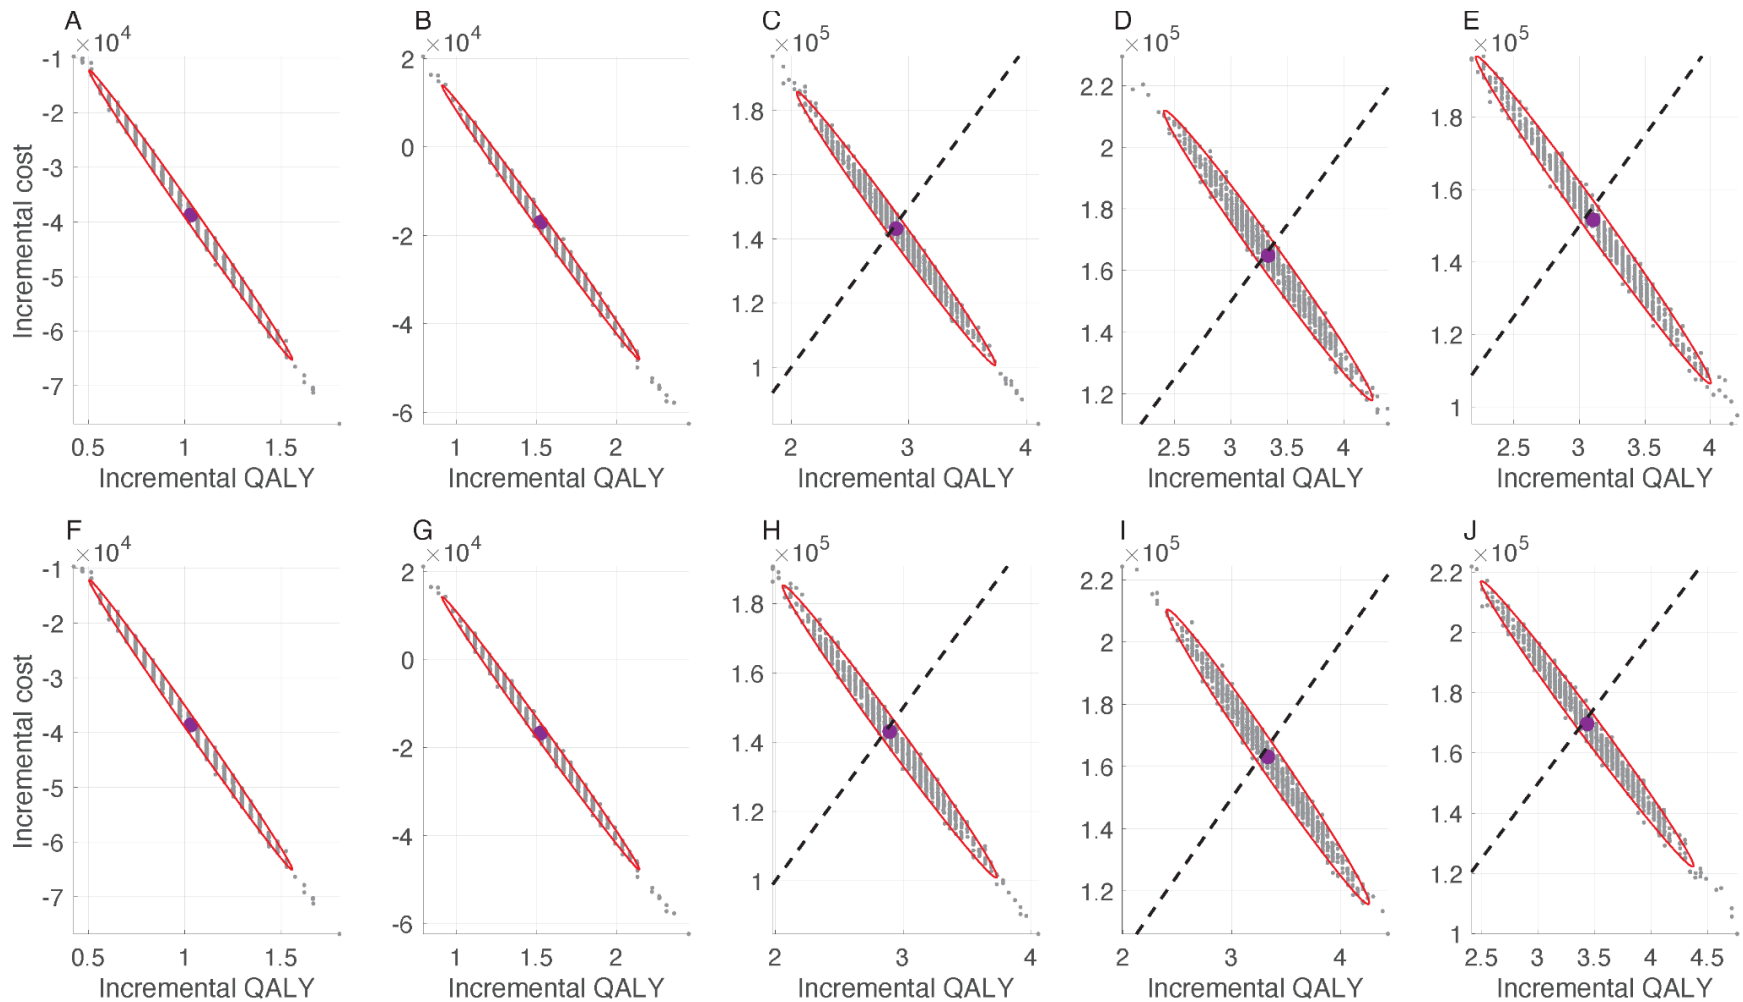

Figure A30. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from a societal perspective using sigmoidal (A,B,C,D,E) and constant (F,G,H,I,J) vaccine efficacy profiles. The maximum PPD for

nirsevimab and RSVpreF correspond to estimates reported in Table A4. Black dashed-line corresponds to the WTP threshold of \$50,000 per QALY gained.

7.3. 80% coverage of nirsevimab and 60% coverage of maternal vaccination without monetary loss of life

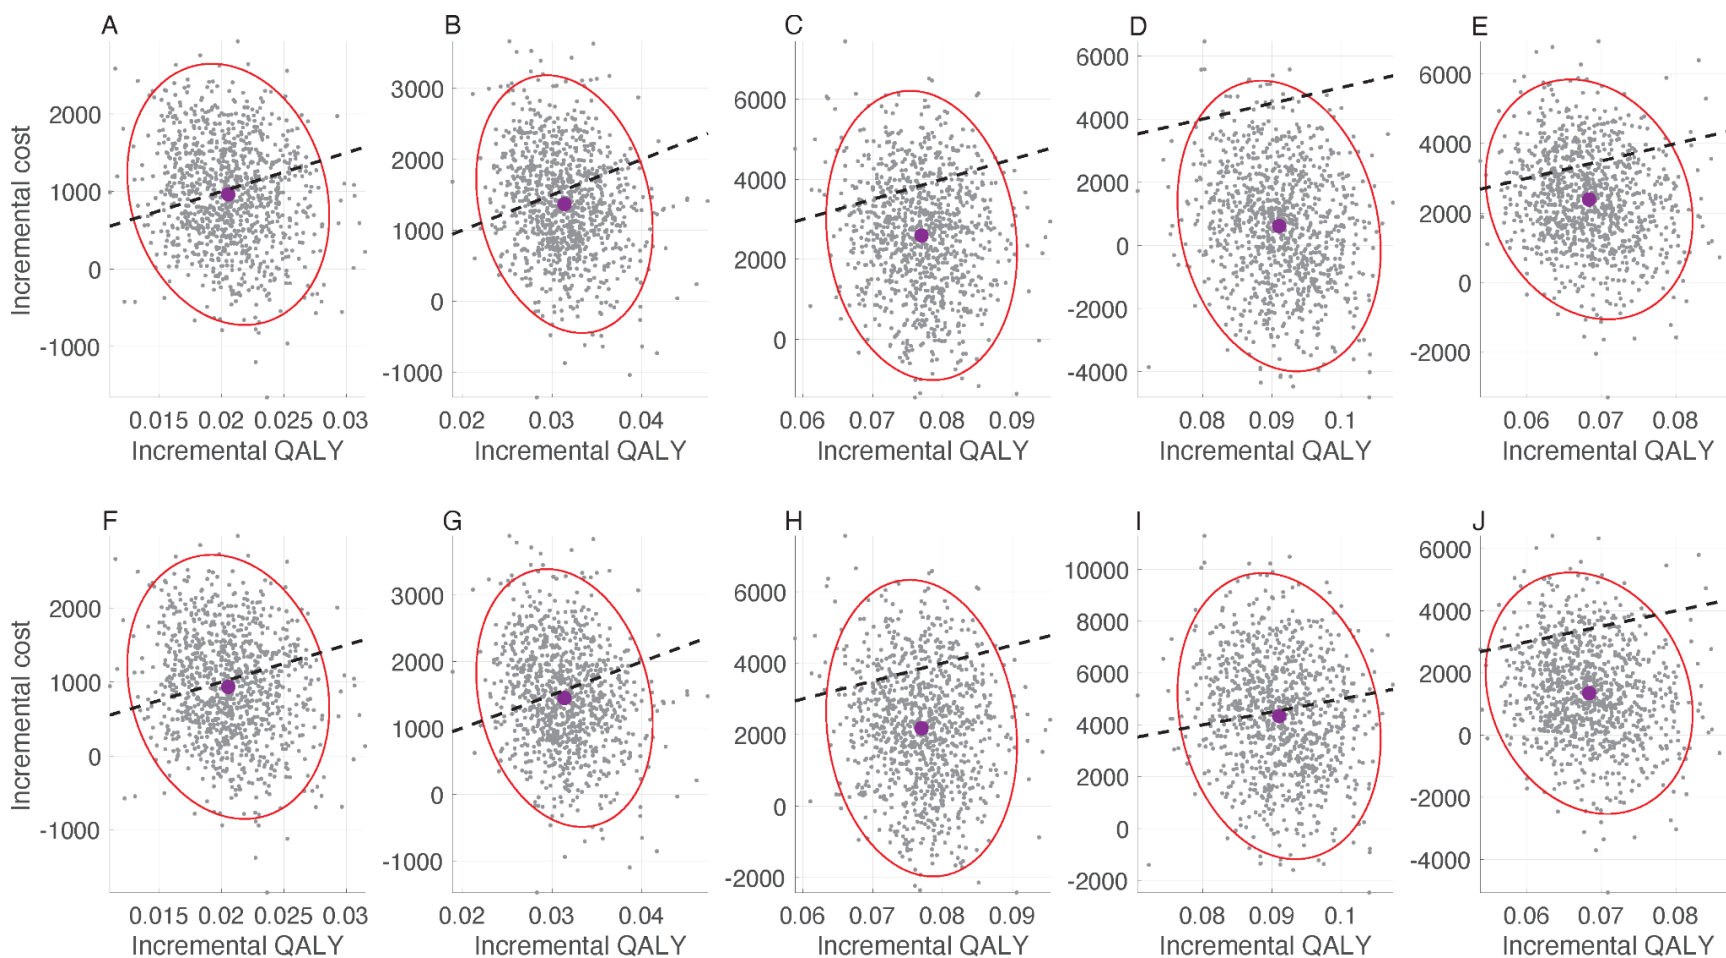

Figure A31. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from healthcare (A,B,C,D,E) and societal (F,G,H,I,J) perspectives using sigmoidal vaccine efficacy profiles. The maximum PPD for

nirsevimab and RSVpreF correspond to estimates reported in Table A7. Black dashed-line corresponds to the WTP threshold of \$50,000 per QALY gained.

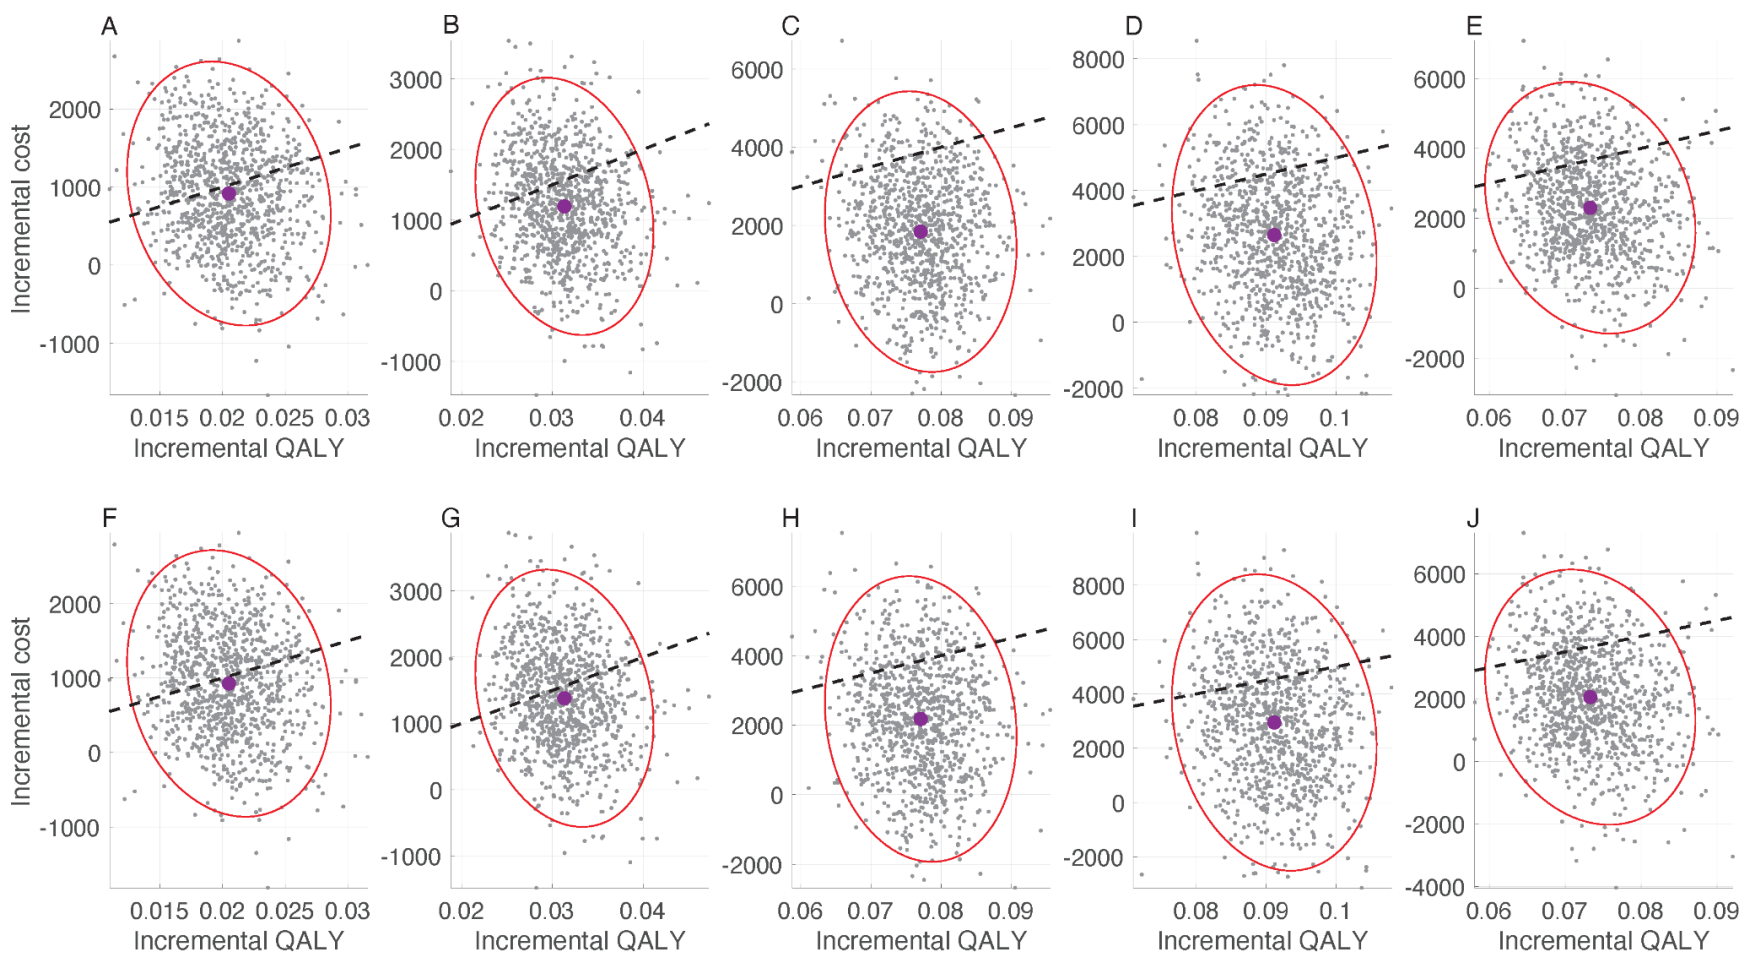

Figure A32. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from healthcare (A,B,C,D,E) and societal (F,G,H,I,J) perspectives using constant vaccine efficacy profiles. The maximum PPD for

nirsevimab and RSVpreF correspond to estimates reported in Table A8. Black dashed-line corresponds to the WTP threshold of \$50,000 per QALY gained.

7.4. 80% coverage of nirsevimab and 60% coverage of maternal vaccination with monetary loss of life

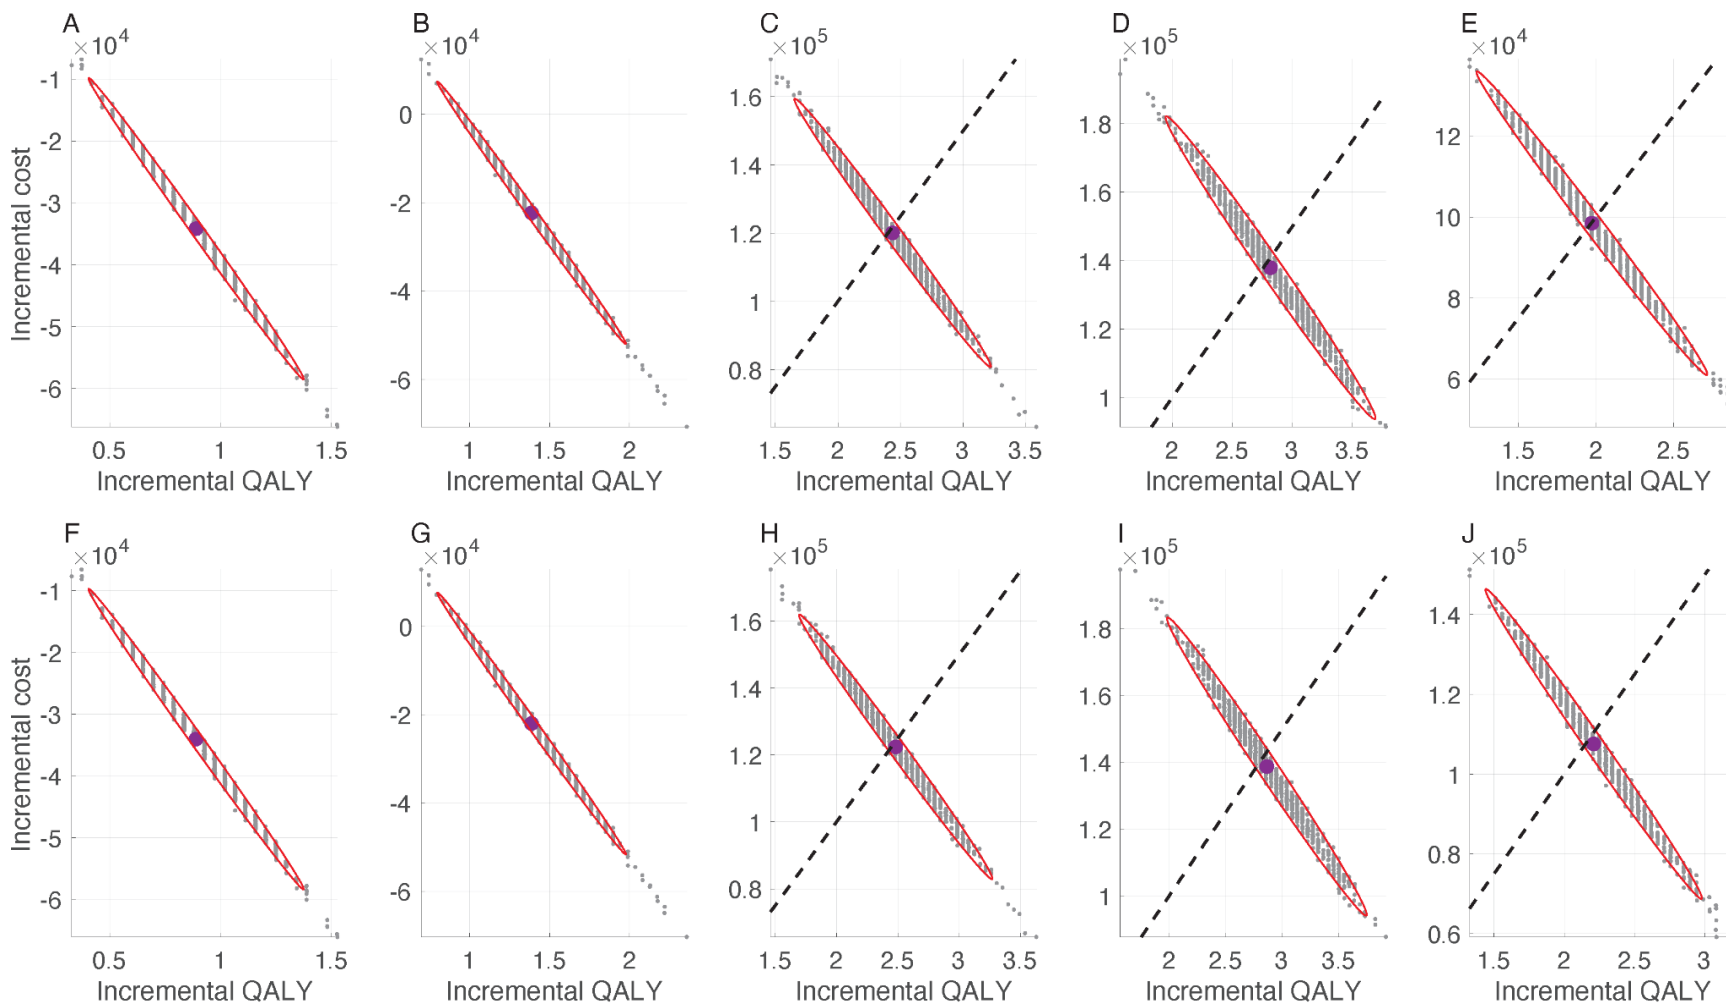

Figure A33. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from a societal perspective using sigmoidal (A,B,C,D,E) and constant (F,G,H,I,J) vaccine efficacy profiles. The maximum PPD for

nirsevimab and RSVpreF correspond to estimates reported in Table A11. Black dashed-line corresponds to the WTP threshold of \$50,000 per QALY gained.

8. Cost-effectiveness planes for immunisation programs with the WTP of \$30,000 per QALY gained

8.1. 100% coverage of nirsevimab and 100% coverage of maternal vaccination without monetary loss of life

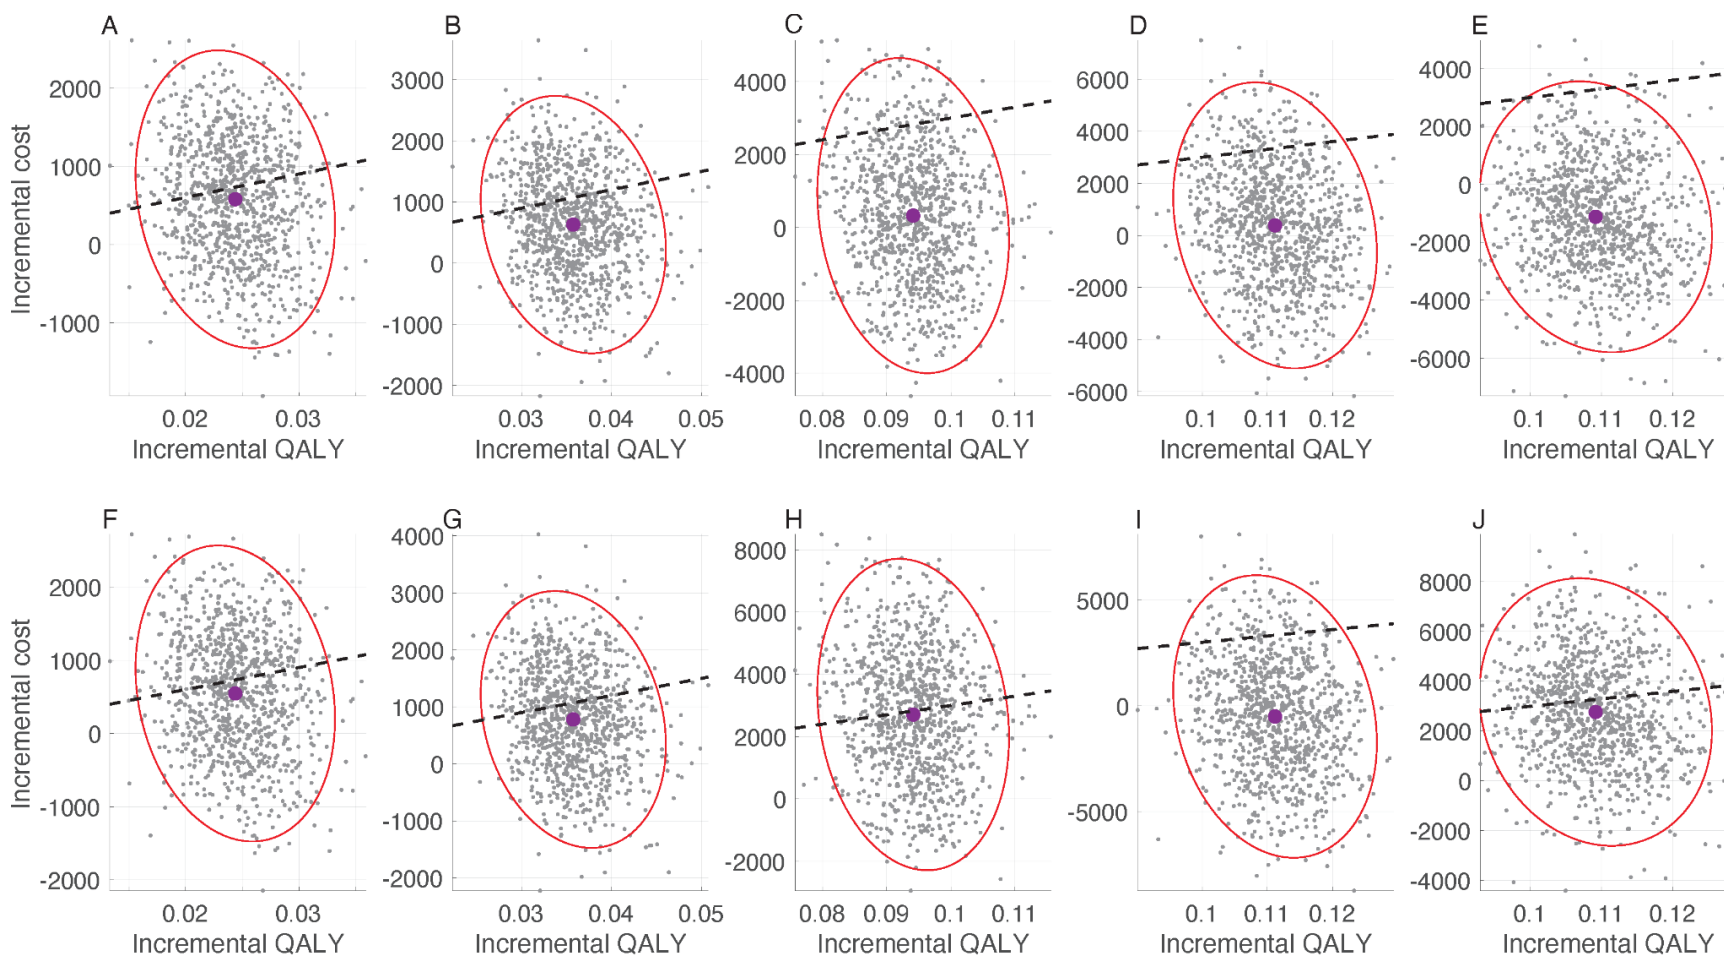

Figure A34. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from healthcare (A,B,C,D,E) and societal (F,G,H,I,J) perspectives using sigmoidal vaccine efficacy profiles. The maximum PPD for nirsevimab and RSVpreF correspond to estimates reported in Table A13. Black dashed-line corresponds to the WTP threshold of \$30,000 per QALY gained.

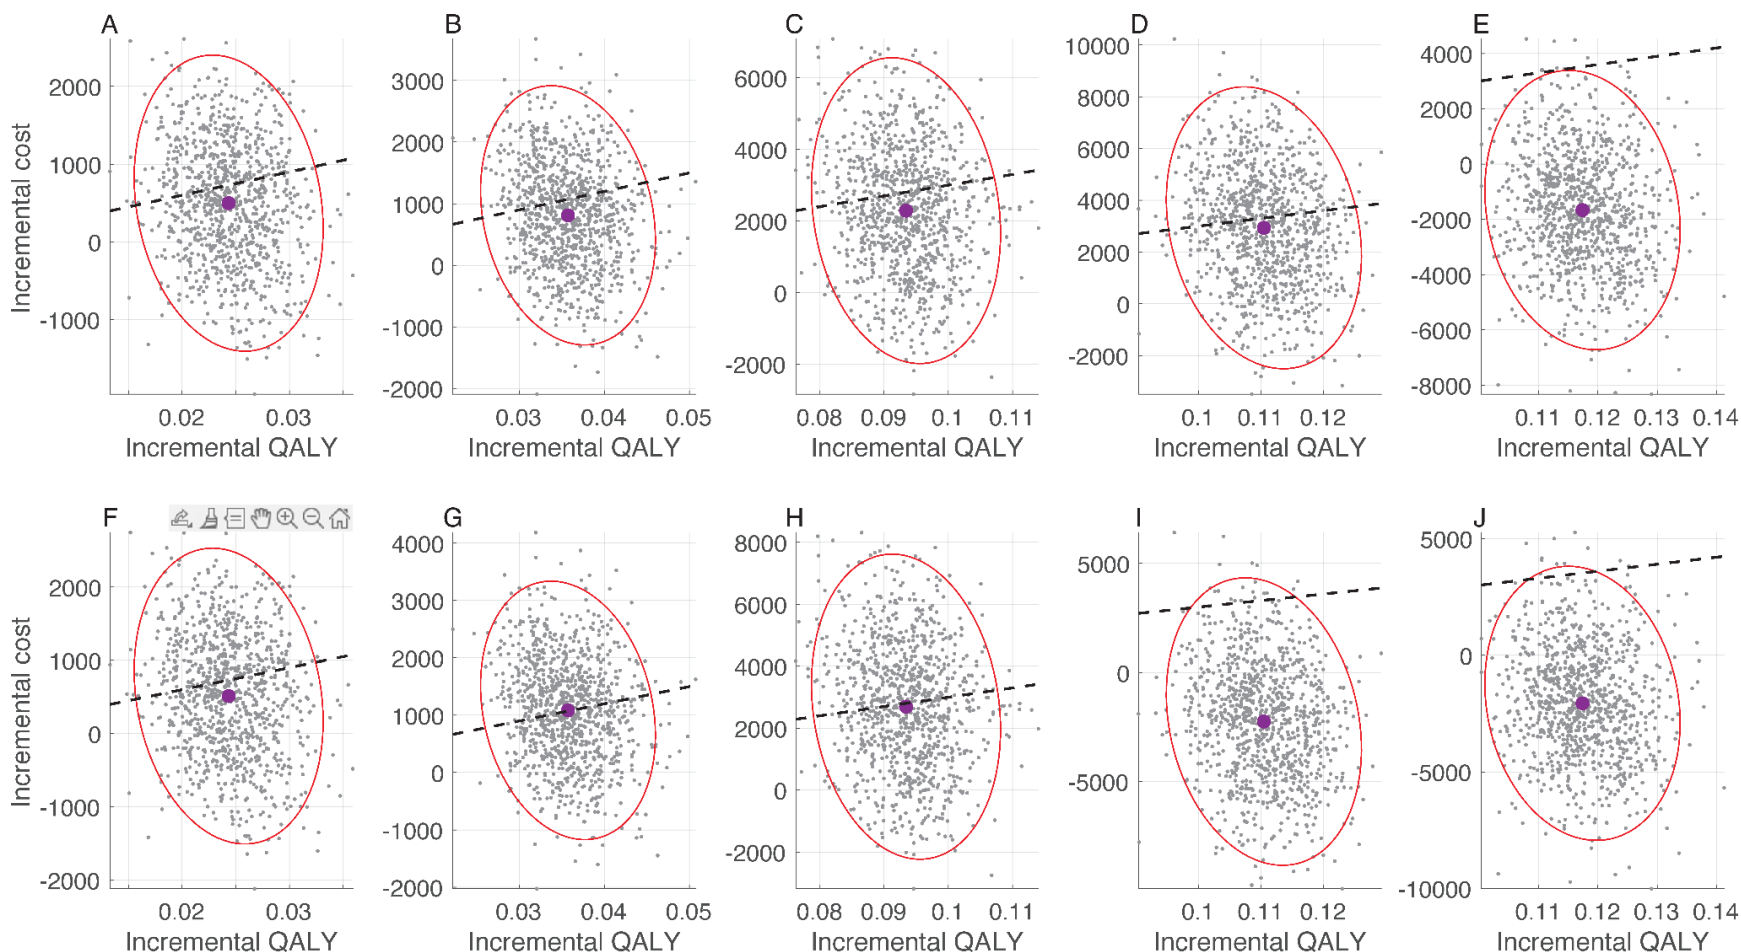

Figure A35. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI

from healthcare (A,B,C,D,E) and societal (F,G,H,I,J) perspectives using constant vaccine efficacy profiles. The maximum PPD for nirsevimab and RSVpreF correspond to estimates reported in Table A14. Black dashed-line corresponds to the WTP threshold of \$30,000 per QALY gained.

8.2. 100% coverage of nirsevimab and 100% coverage of maternal vaccination with monetary loss of life

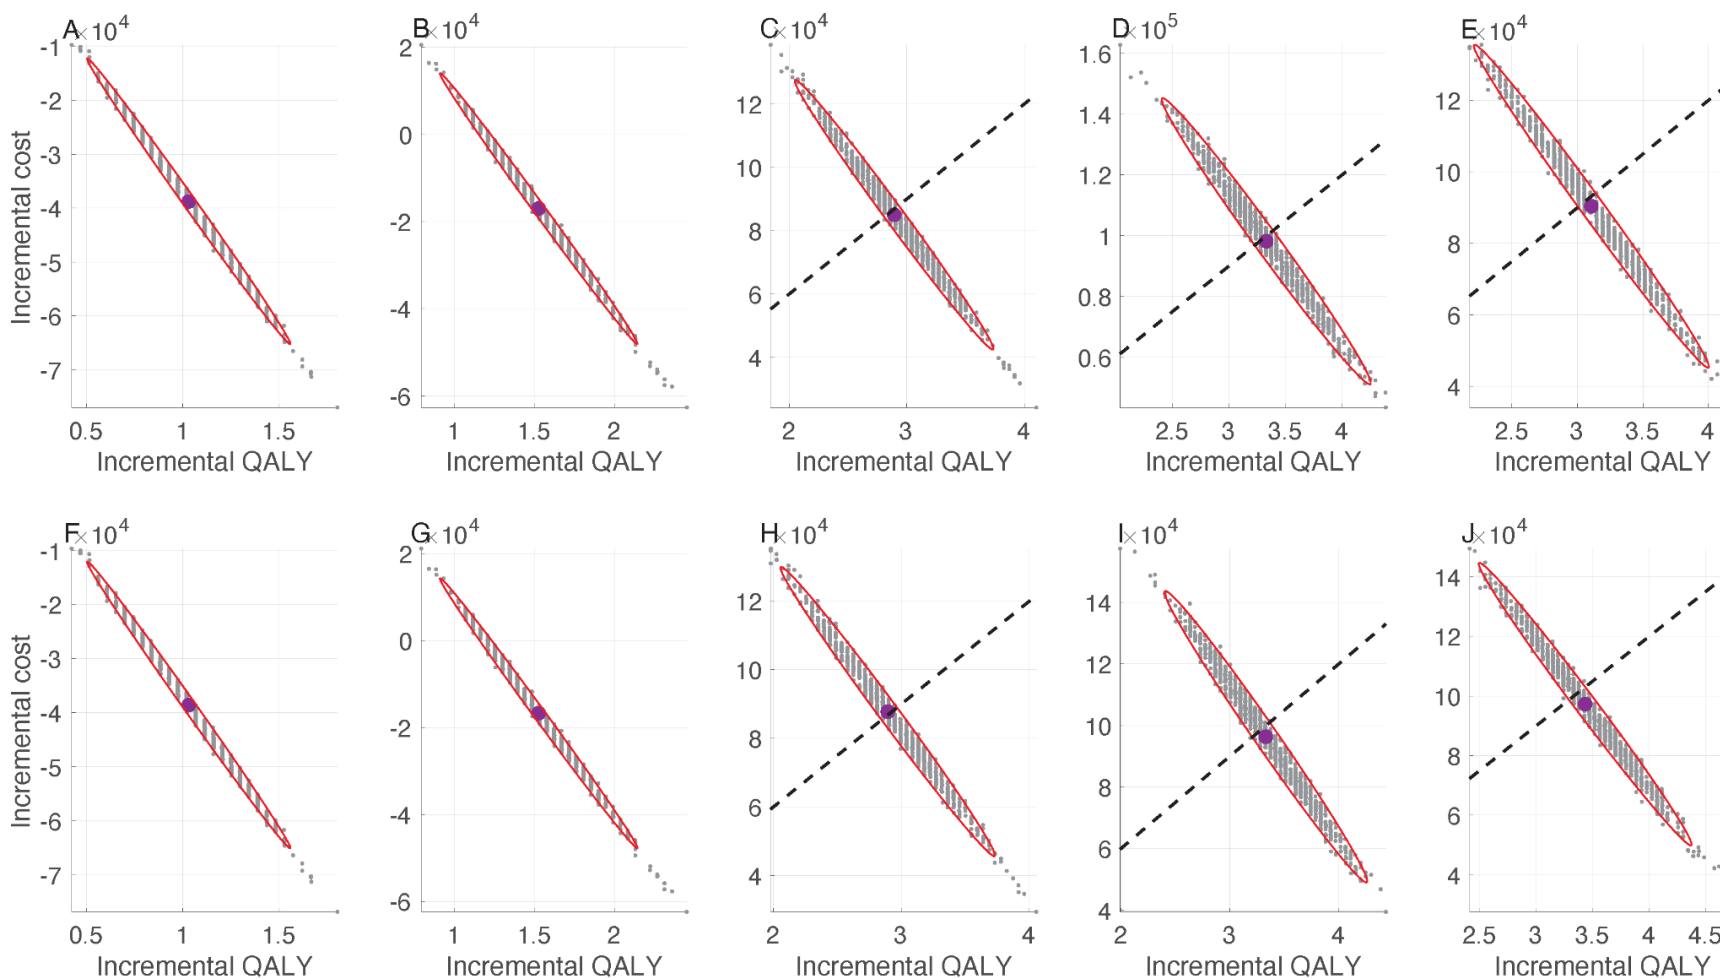

Figure A36. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI

from a societal perspective using sigmoidal (A,B,C,D,E) and constant (F,G,H,I,J) vaccine efficacy profiles. The maximum PPD for nirsevimab and RSVpreF correspond to estimates reported in Table A17. Black dashed-line corresponds to the WTP threshold of \$30,000 per QALY gained.

8.3. 80% coverage of nirsevimab and 60% coverage of maternal vaccination without monetary loss of life

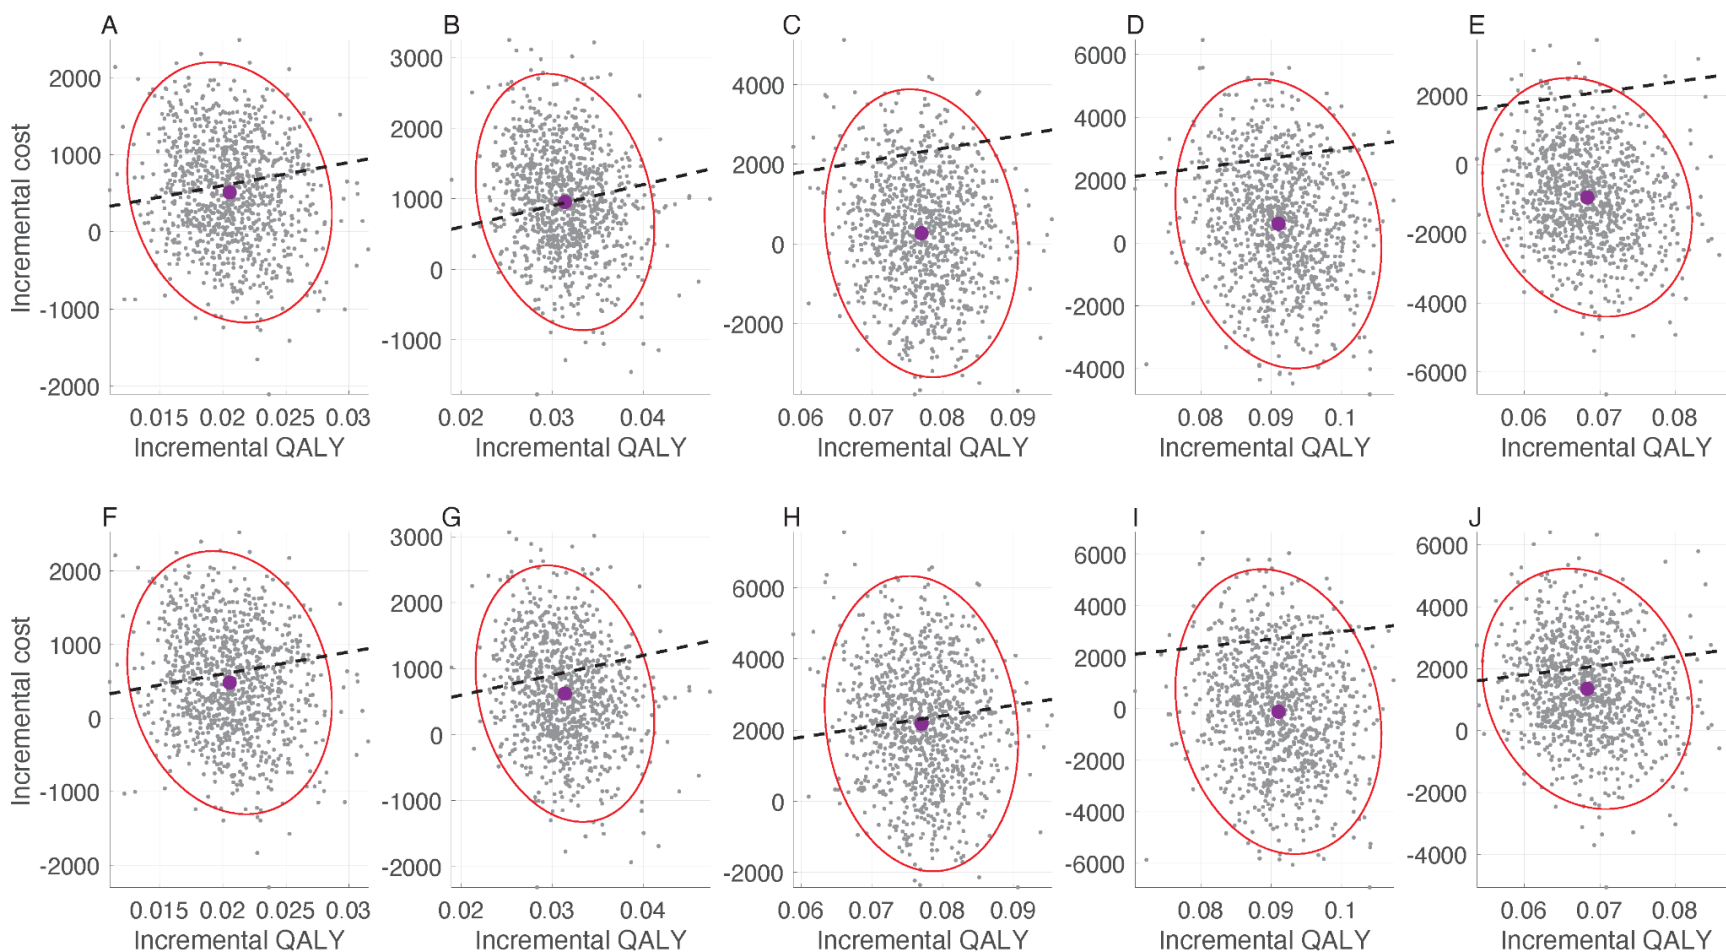

Figure A37. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from healthcare (A,B,C,D,E) and societal (F,G,H,I,J) perspectives using sigmoidal vaccine efficacy profiles. The maximum PPD for

nirsevimab and RSVpreF correspond to estimates reported in Table A19. Black dashed-line corresponds to the WTP threshold of \$30,000 per QALY gained.

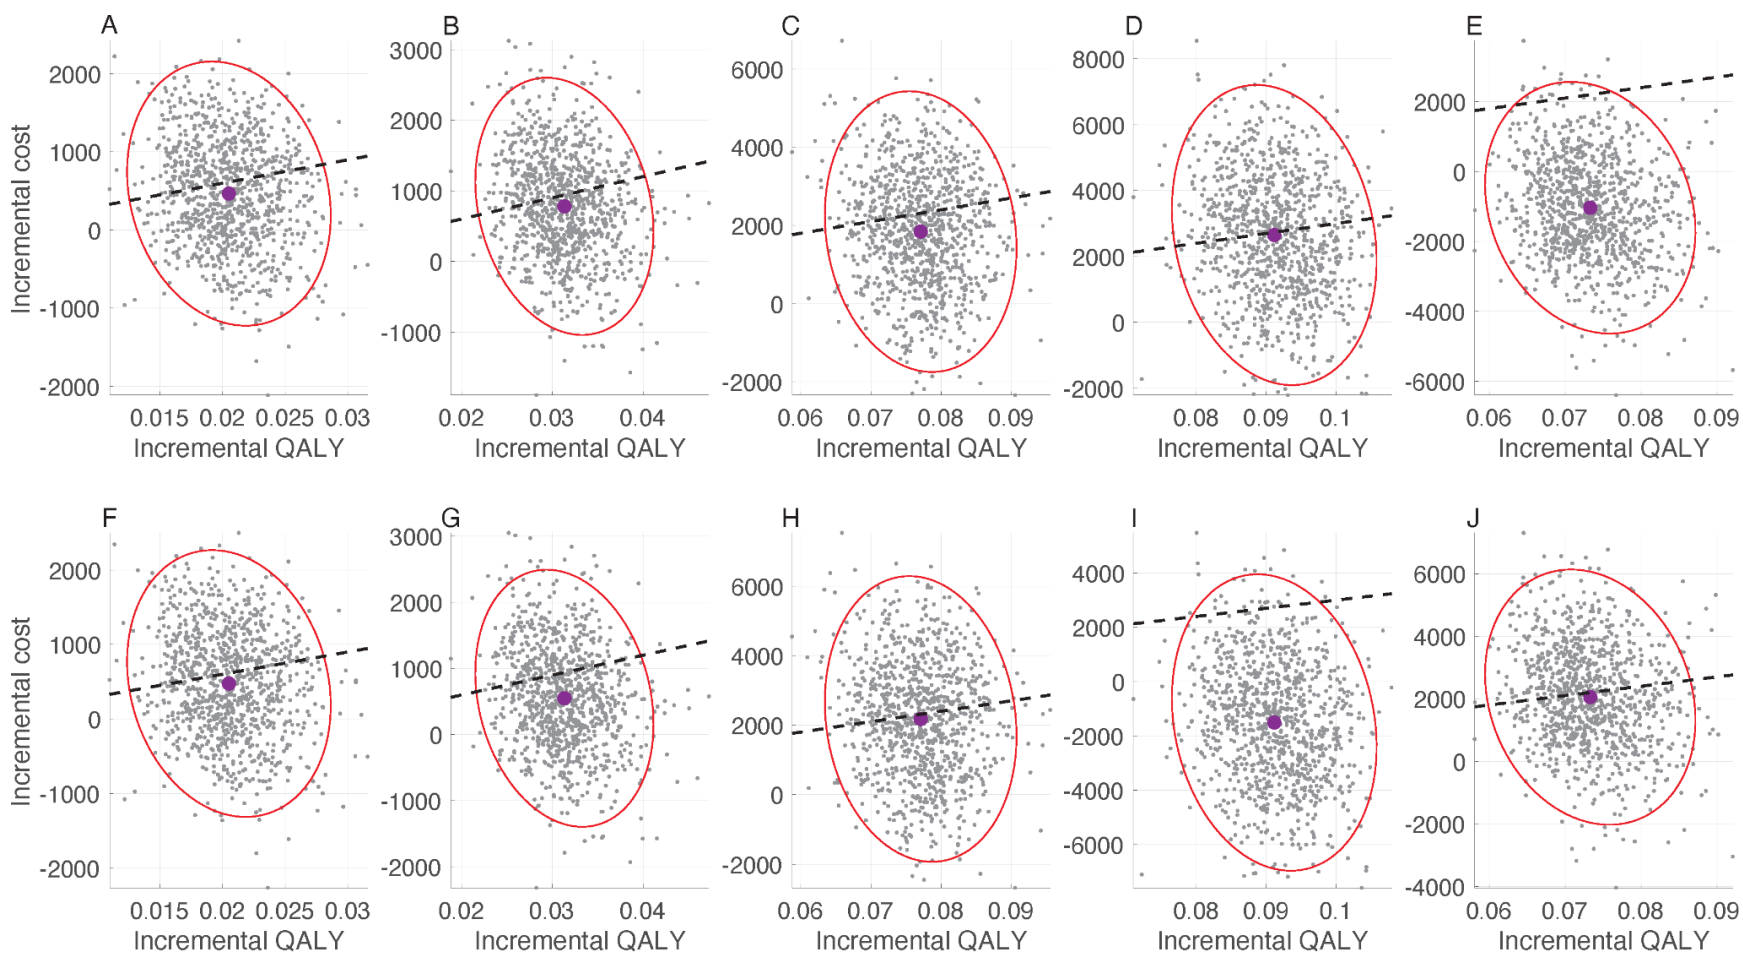

Figure A38. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from healthcare (A,B,C,D,E) and societal (F,G,H,I,J) perspectives using constant vaccine efficacy profiles. The maximum PPD for

nirsevimab and RSVpreF correspond to estimates reported in Table A20. Black dashed-line corresponds to the WTP threshold of \$30,000 per QALY gained.

8.4. 80% coverage of nirsevimab and 60% coverage of maternal vaccination with monetary loss of life

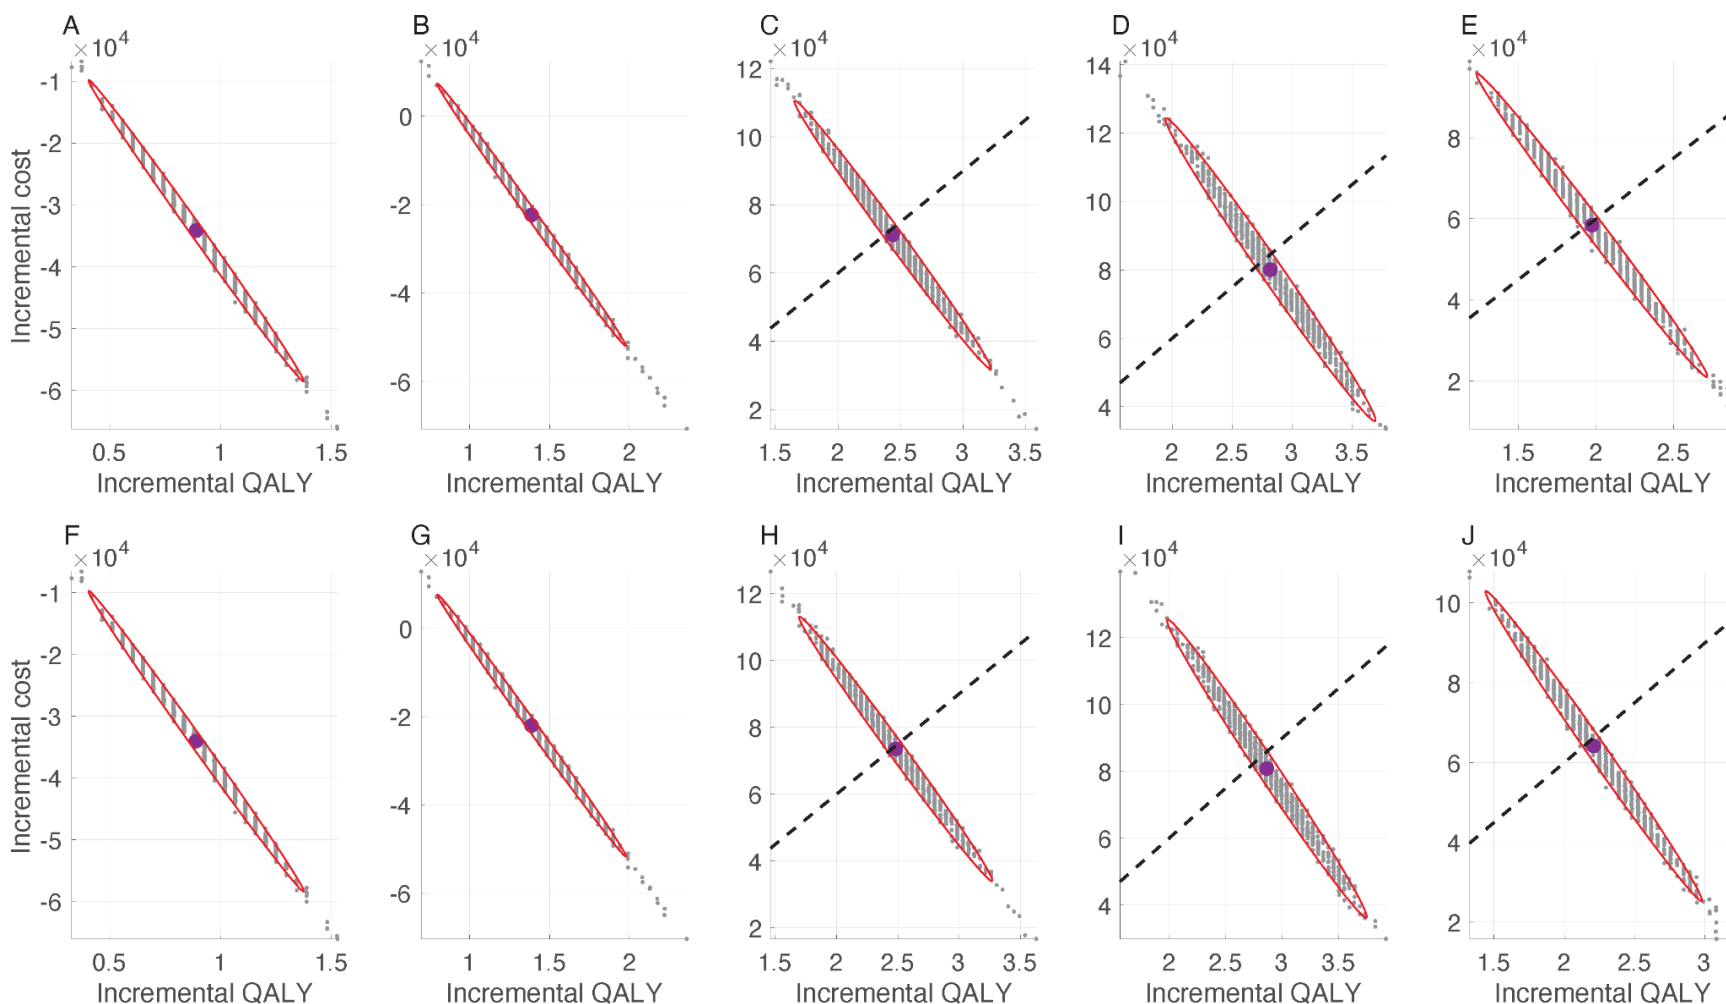

Figure A39. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from a societal perspective using sigmoidal (A,B,C,D,E) and constant (F,G,H,I,J) vaccine efficacy profiles. The maximum PPD for

nirsevimab and RSVpreF correspond to estimates reported in Table A23. Black dashed-line corresponds to the WTP threshold of \$30,000 per QALY gained.

9. Cost-effectiveness planes for immunisation programs with the WTP of \$70,000 per QALY gained

9.1. 100% coverage of nirsevimab and 100% coverage of maternal vaccination without monetary loss of life

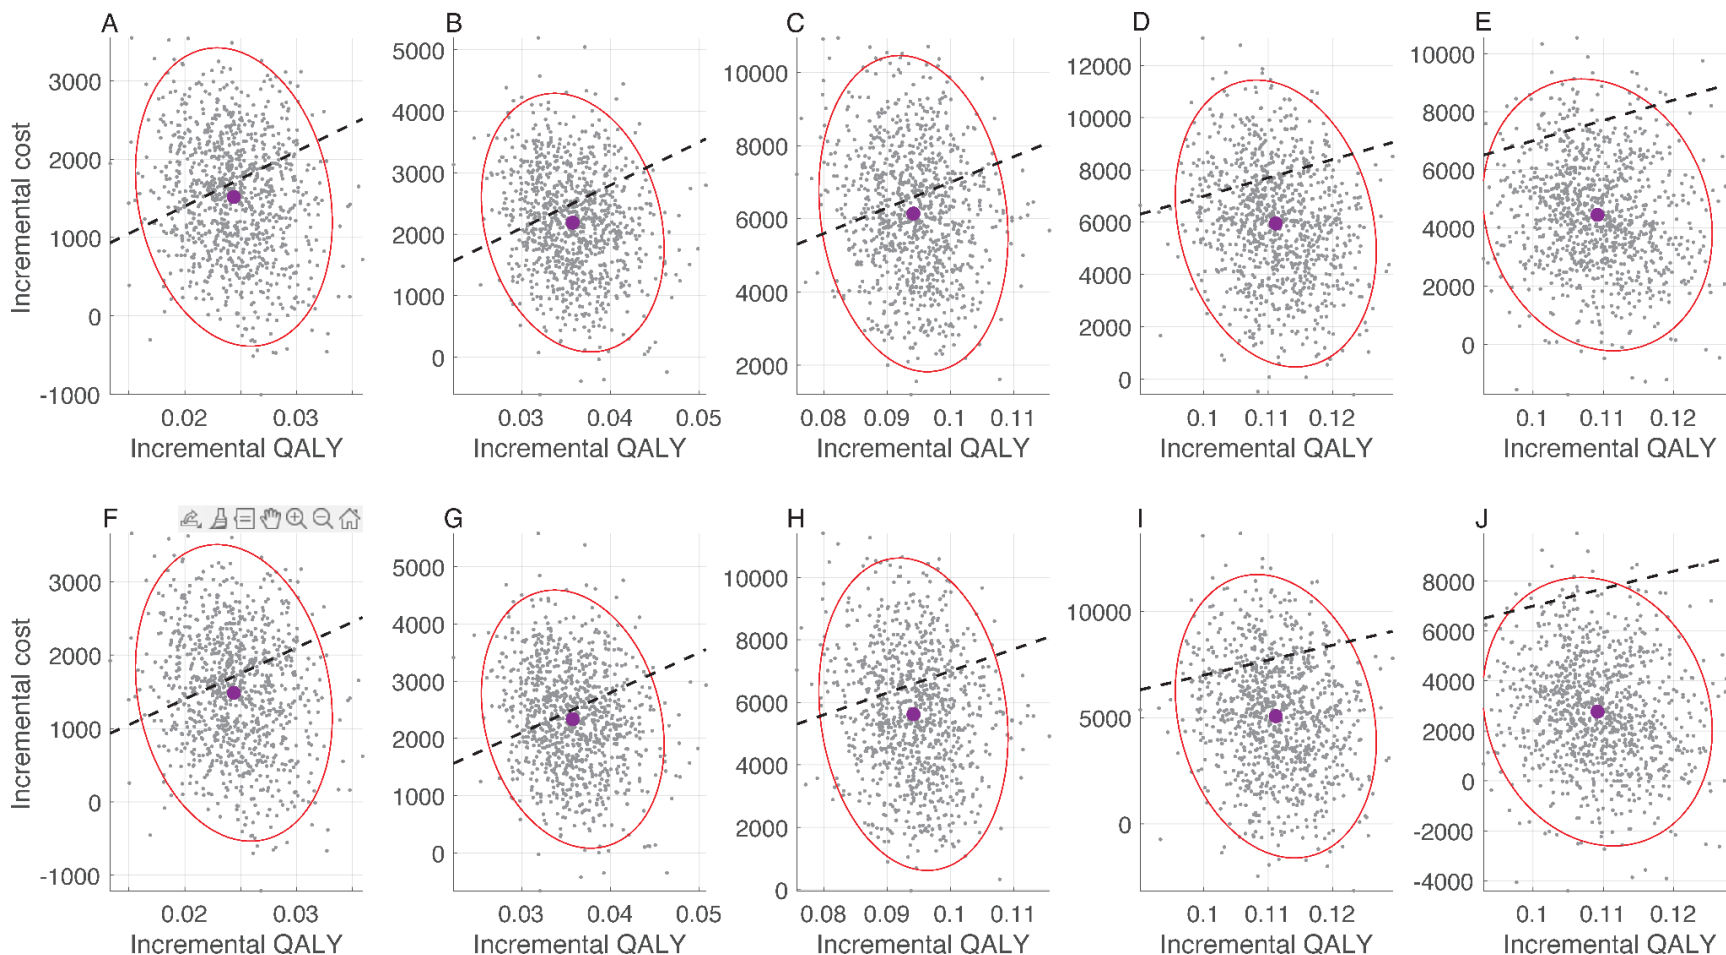

Figure A40. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from healthcare (A,B,C,D,E) and societal (F,G,H,I,J) perspectives using sigmoidal vaccine efficacy profiles. The maximum PPD for nirsevimab and RSVpreF correspond to estimates reported in Table A25. Black dashed-line corresponds to the WTP threshold of \$70,000 per QALY gained.

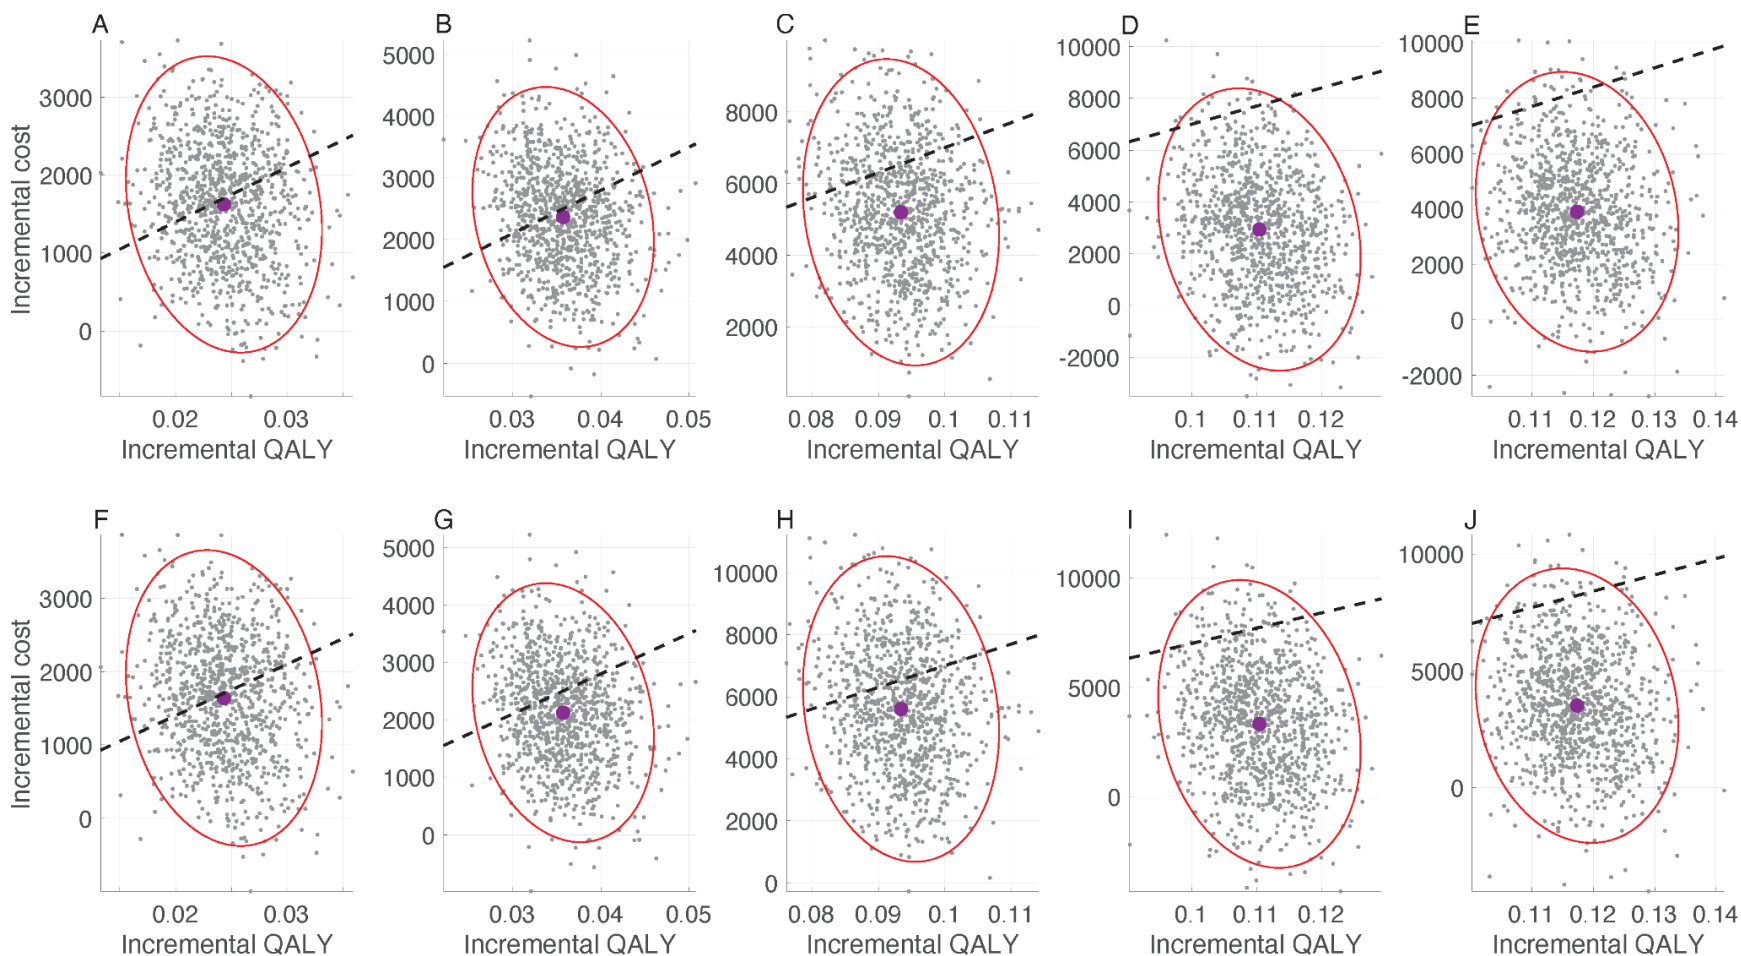

Figure A41. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from healthcare (A,B,C,D,E) and societal (F,G,H,I,J) perspectives using constant vaccine efficacy profiles. The maximum PPD for

nirsevimab and RSVpreF correspond to estimates reported in Table A26. Black dashed-line corresponds to the WTP threshold of \$70,000 per QALY gained.

9.2. 100% coverage of nirsevimab and 100% coverage of maternal vaccination with monetary loss of life

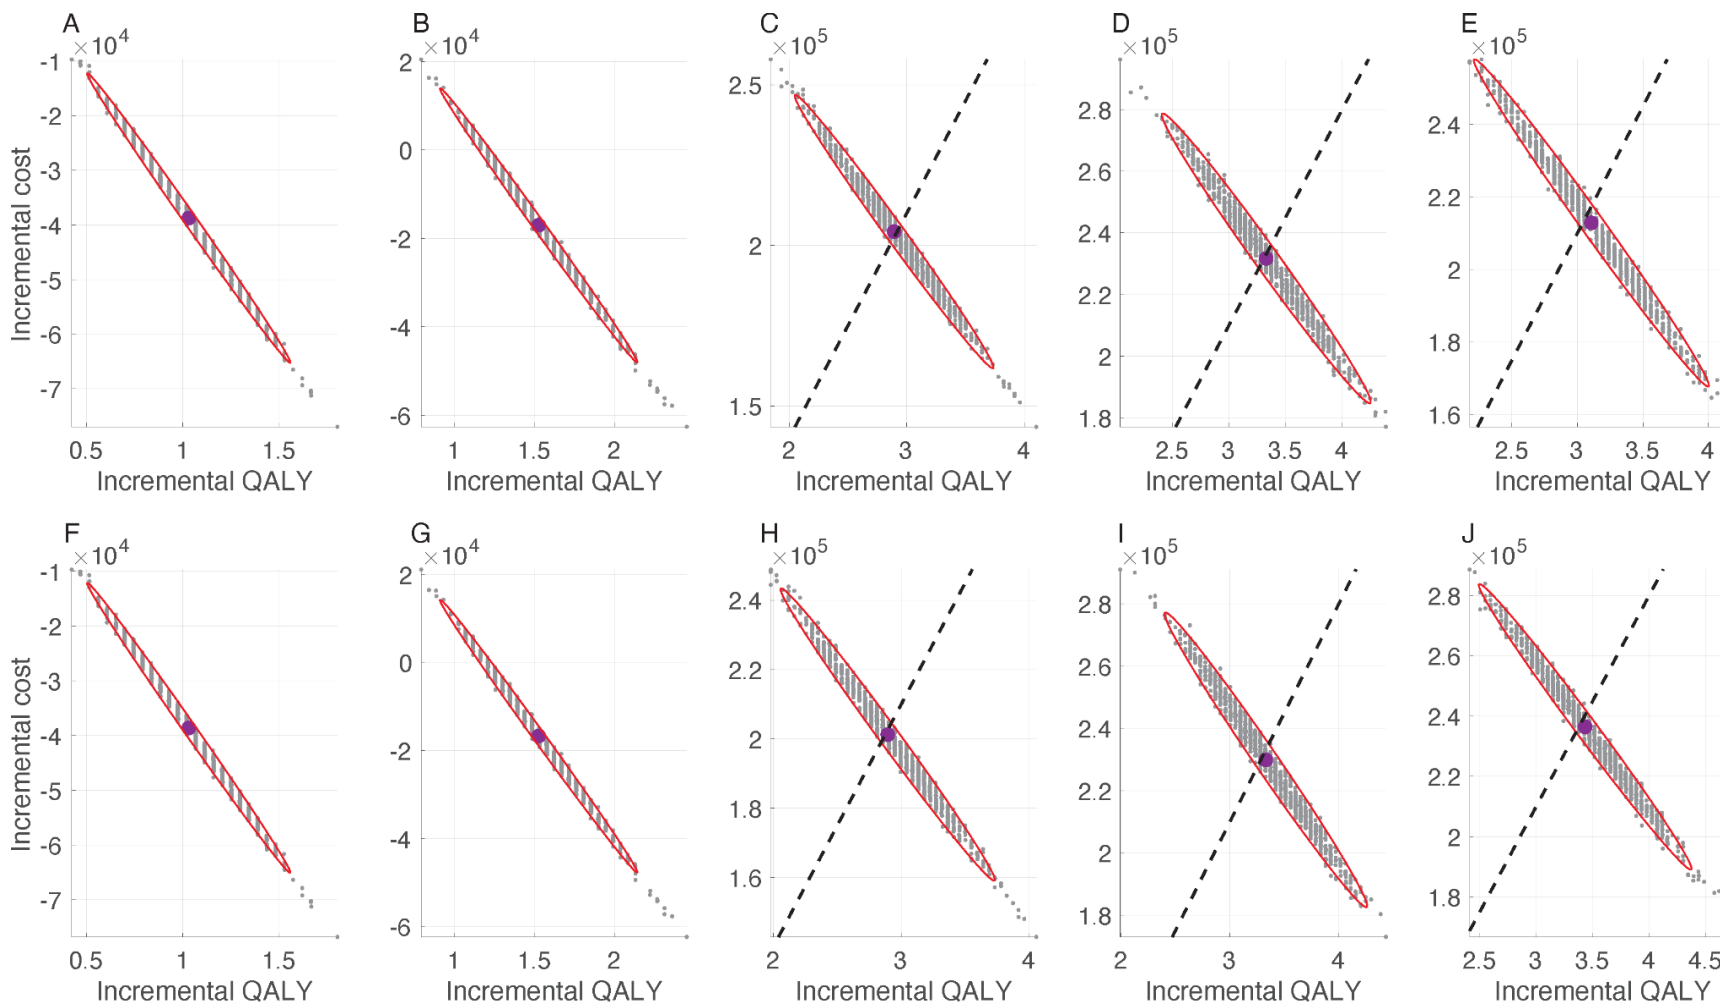

Figure A42. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from a societal perspective using sigmoidal (A,B,C,D,E) and constant (F,G,H,I,J) vaccine efficacy profiles. The maximum PPD for

nirsevimab and RSVpreF correspond to estimates reported in Table A29. Black dashed-line corresponds to the WTP threshold of \$70,000 per QALY gained.

9.3. 80% coverage of nirsevimab and 60% coverage of maternal vaccination without monetary loss of life

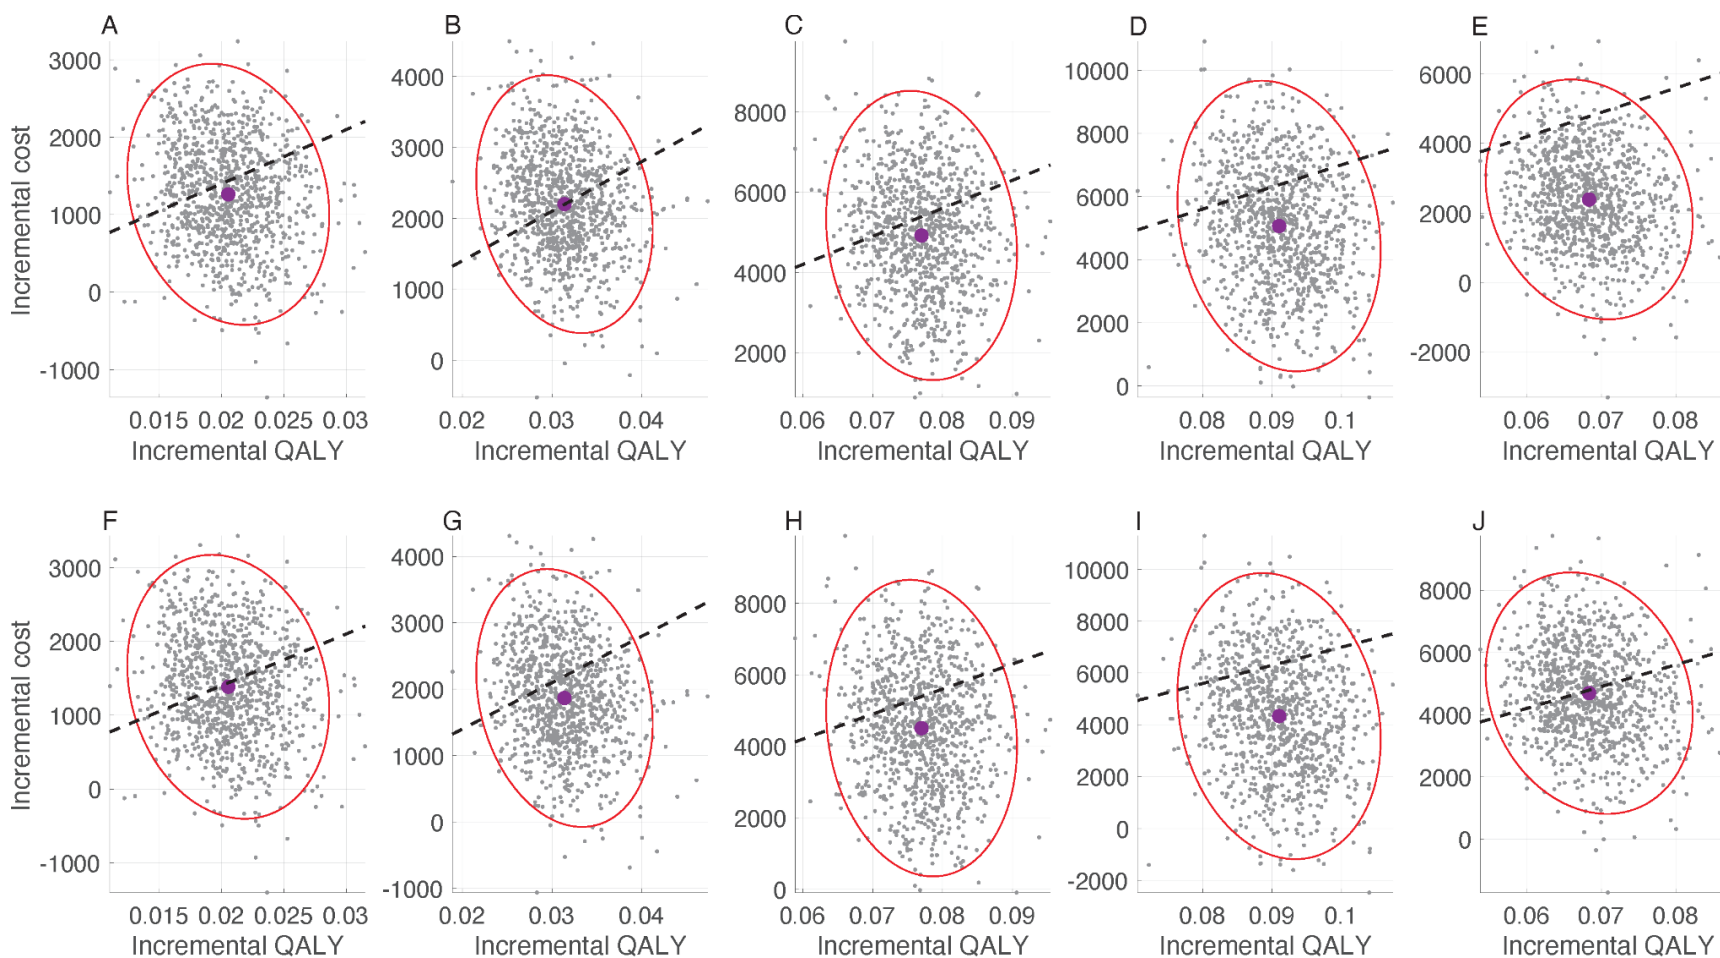

Figure A43. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from healthcare (A,B,C,D,E) and societal (F,G,H,I,J) perspectives using sigmoidal vaccine efficacy profiles. The maximum PPD for

nirsevimab and RSVpreF correspond to estimates reported in Table A31. Black dashed-line corresponds to the WTP threshold of \$70,000 per QALY gained.

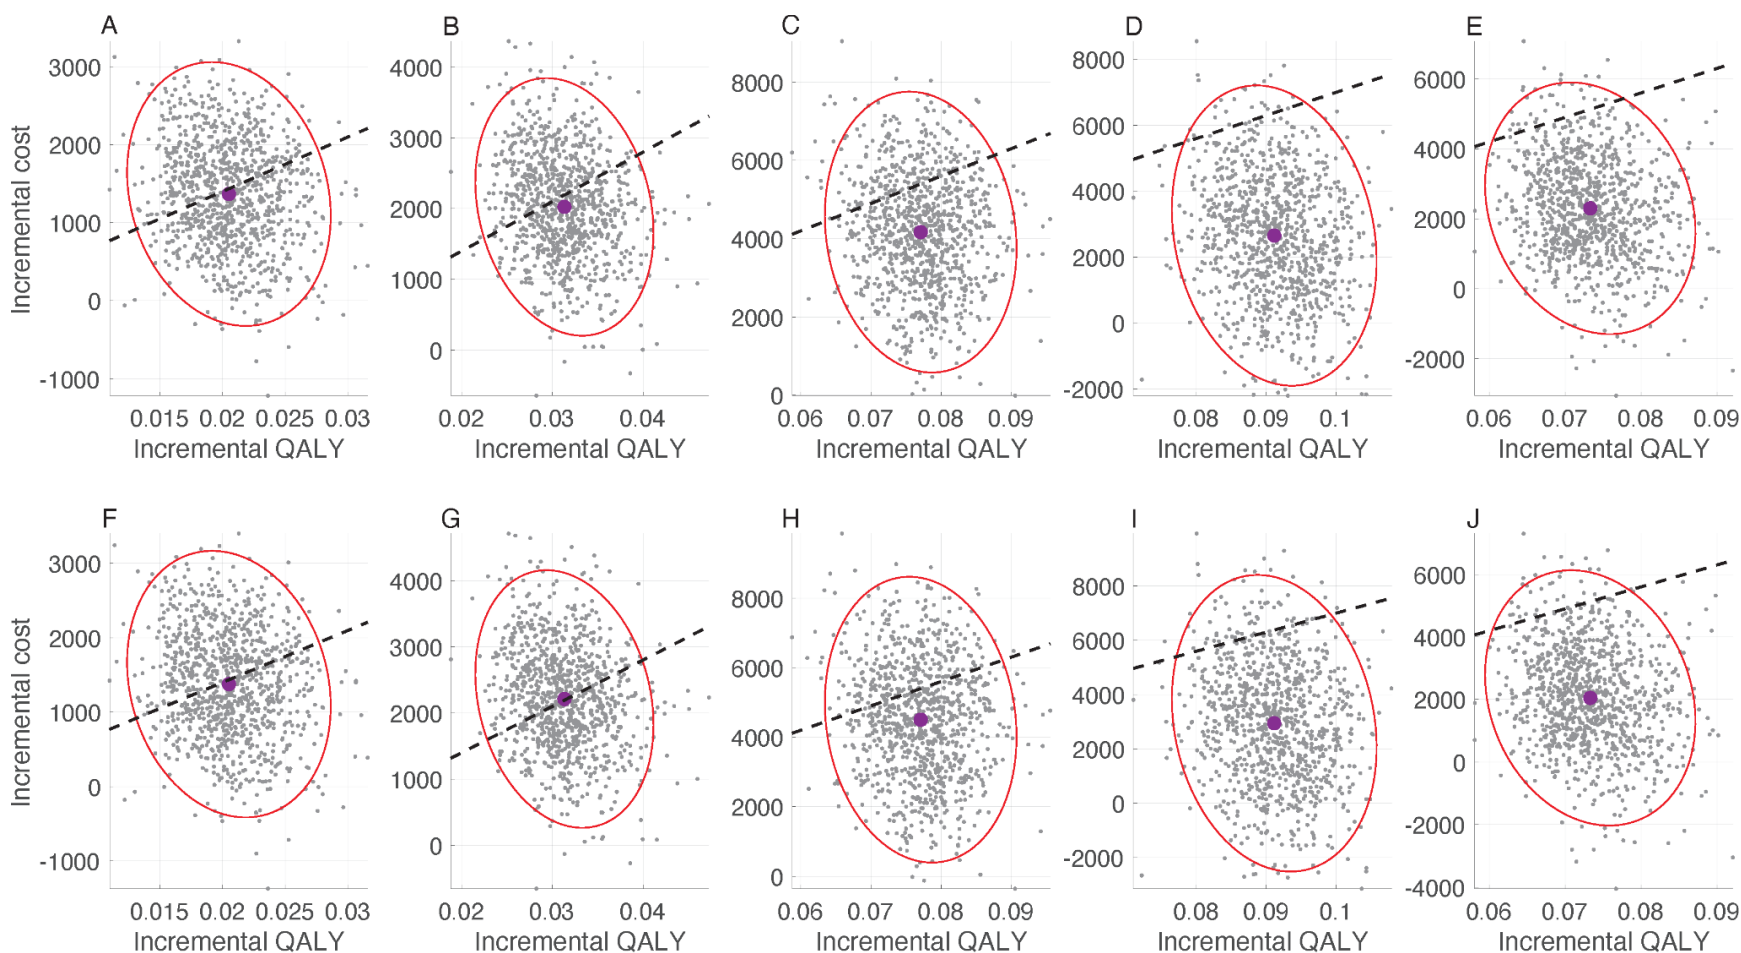

Figure A44. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from healthcare (A,B,C,D,E) and societal (F,G,H,I,J) perspectives using constant vaccine efficacy profiles. The maximum PPD for nirsevimab and RSVpreF correspond to estimates reported in Table A32. Black dashed-line corresponds to the WTP threshold of \$70,000 per QALY gained.

9.4. 80% coverage of nirsevimab and 60% coverage of maternal vaccination with monetary loss of life

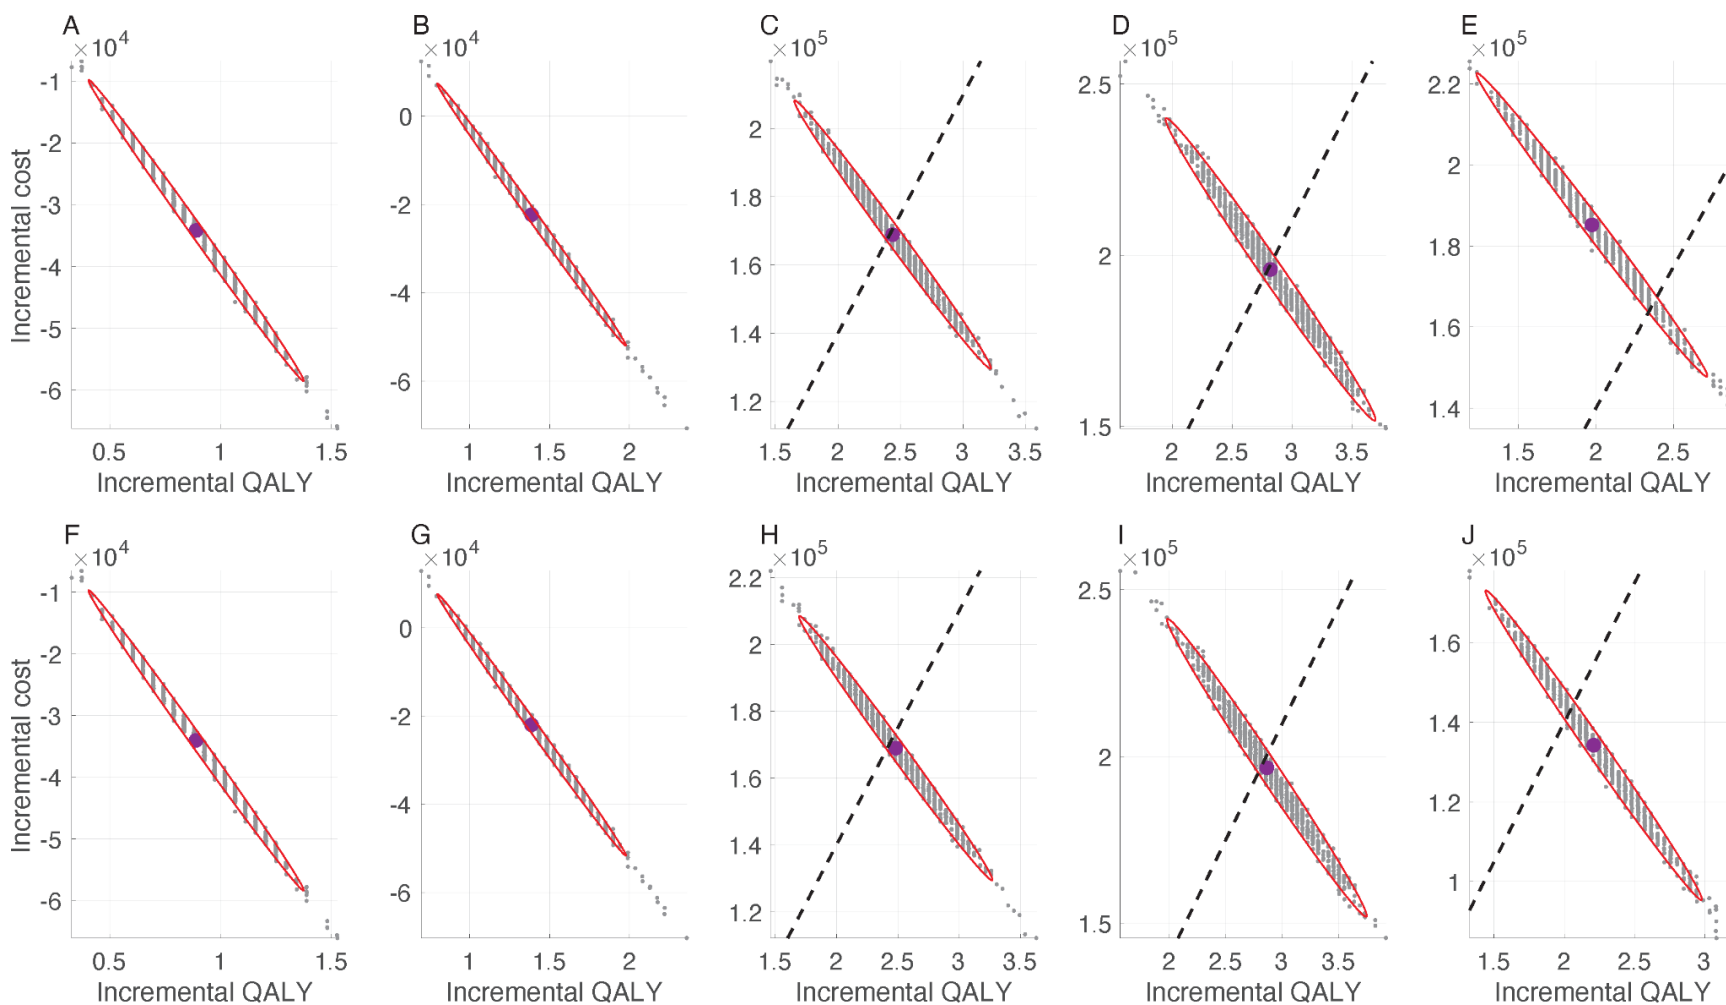

Figure A45. Cost-effectiveness planes for standalone immunisation programs: (A,F) L1; (B,G) L2; (C,H) L3; (D,I) L4, and (E,J) MI from a societal perspective using sigmoidal (A,B,C,D,E) and constant (F,G,H,I,J) vaccine efficacy profiles. The maximum PPD for nirsevimab and RSVpreF correspond to estimates reported in Table A35. Black dashed-line corresponds to the WTP threshold of \$70,000 per QALY gained.
