Figure S1. Histograms of all measured protein levels (* 1x10⁵). Asterisks denotes bi-modal proteins.

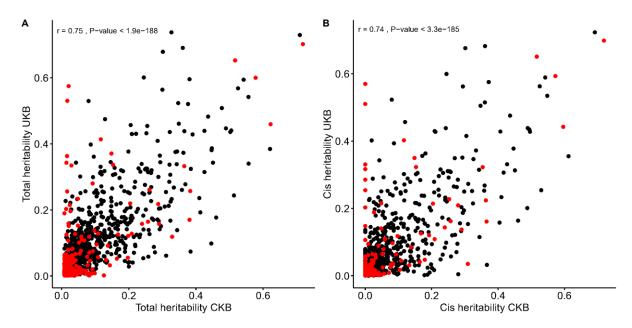

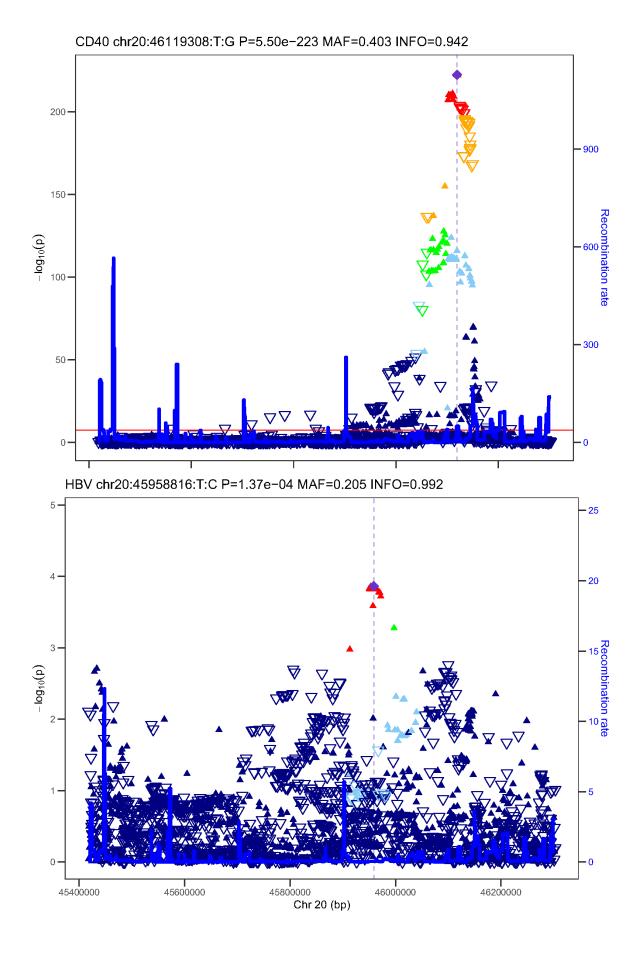

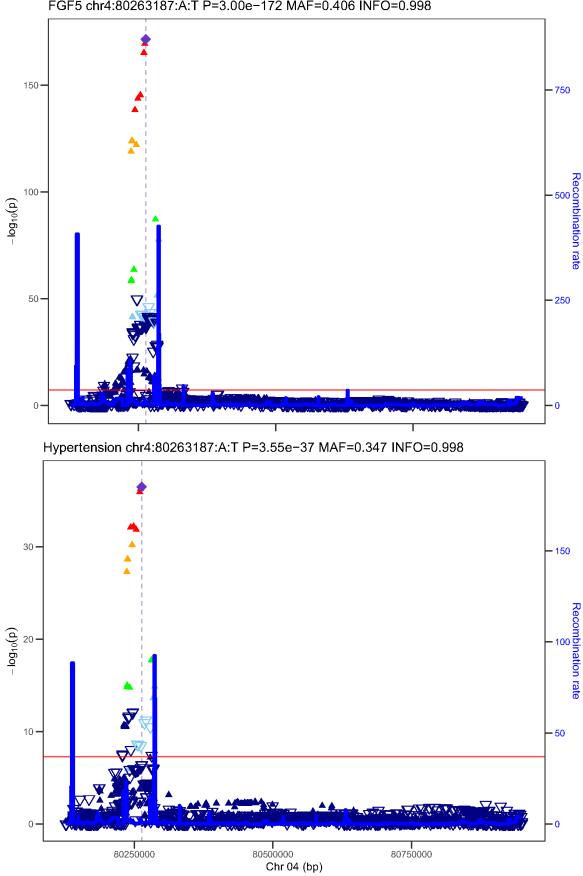

Figure S2. Pearson's correlation between CKB and UKB proteomic data for (A) total heritability and (B) *cis*-heritability. Red points are of proteins which have no credible set overlap with UKB.

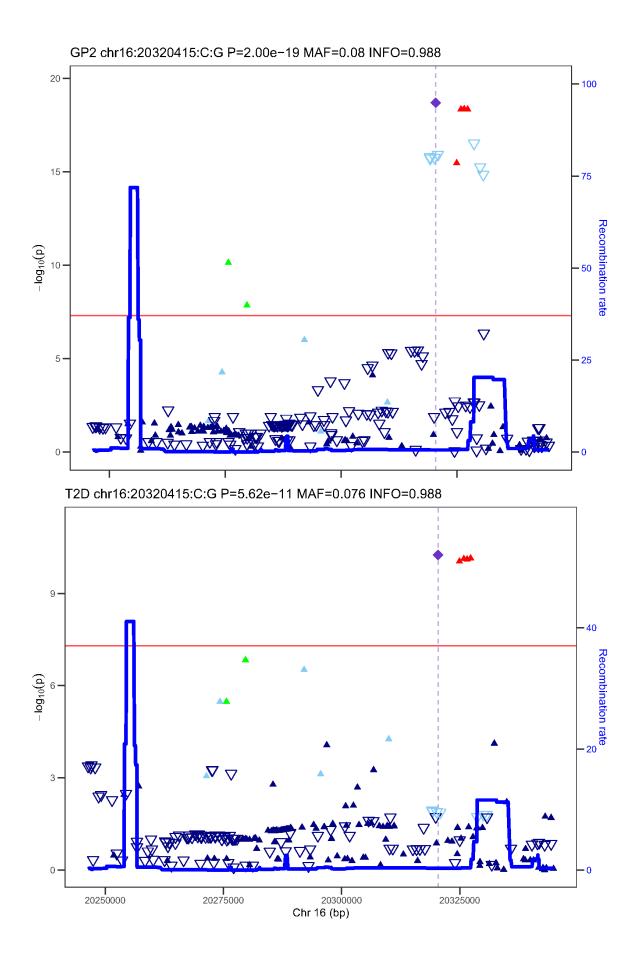

Figure S3. Clinical measurements associated with proteins in Phenome scan of GWAS catalogue. The analyses were based on a search of lead protein *cis*-pQTLs or their

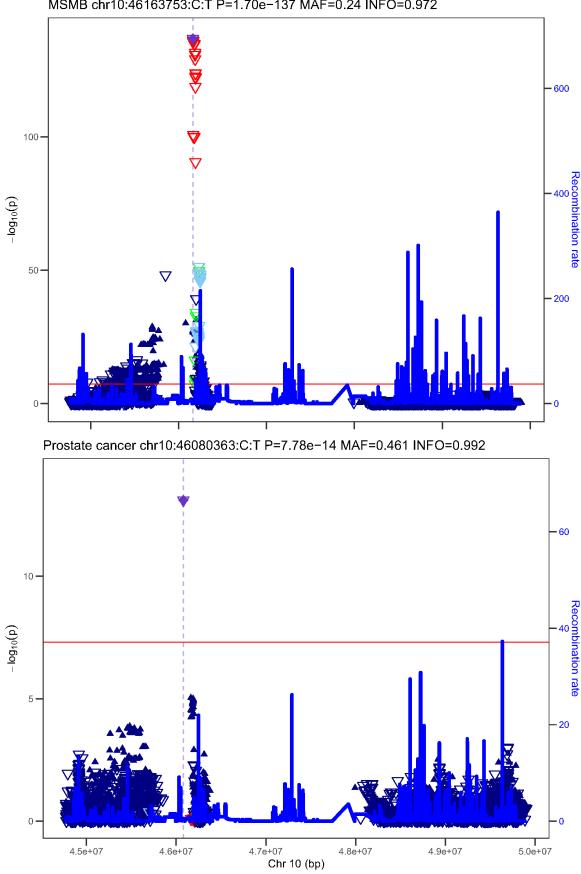

proxy with available estimates. Red dotted line is the Bonferroni adjusted threshold, black is genome-wide significant threshold. Proteins with asterisks had no overlapping credible sets in EUR CS. Hashtag denotes where *cis*-pQTL is in protein gene and UKB-PPP lead *cis*-pQTL not in protein gene. The trait with the smallest P-value was labelled in each panel.

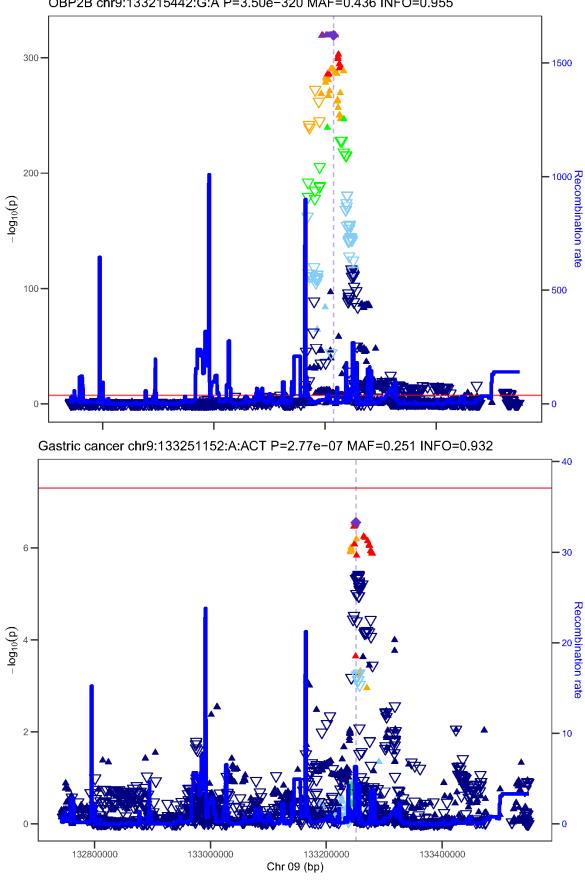

FGF5 chr4:80263187:A:T P=3.00e-172 MAF=0.406 INFO=0.998

MSMB chr10:46163753:C:T P=1.70e-137 MAF=0.24 INFO=0.972

OBP2B chr9:133215442:G:A P=3.50e-320 MAF=0.436 INFO=0.955

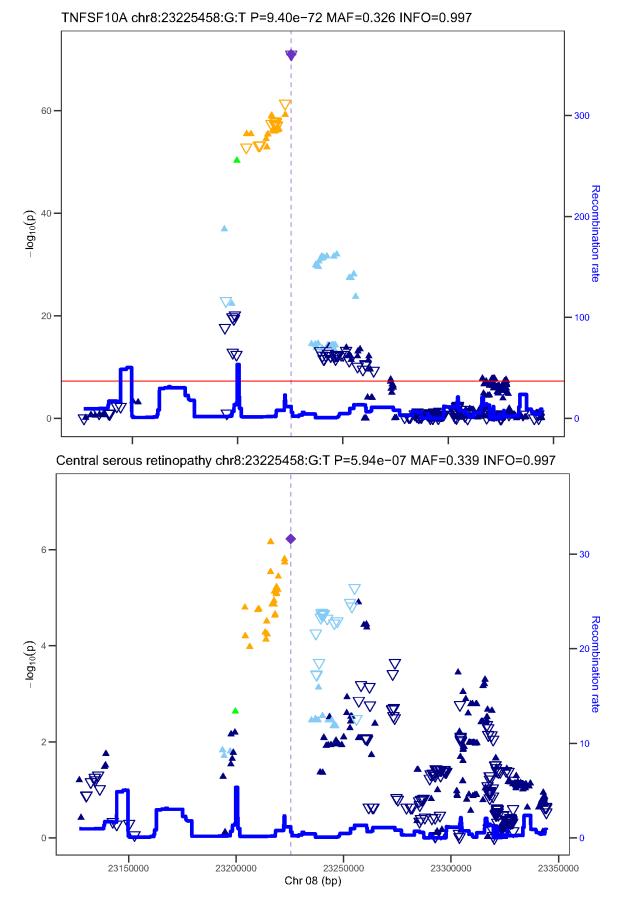

Figure S4-9. Locus zoom plots for EAS specific protein-disease pairs identified.

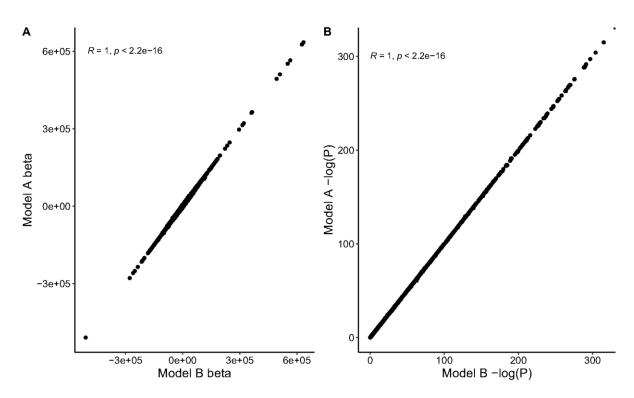

Figure S10. Sensitivity tests of lead pQTL genotype tested with protein levels using different models in (A) comparison by effect size (beta), and (B) comparison by P-value. Model A: without ascertainment of ischaemic heart disease case status; Model B with ascertainment.
