## Abstract (227/300)

### Background and aims

Extended release buprenorphine injection (INJ-BUP) has been available in the United States since 2018. INJ-BUP has the potential to positively impact OUD treatment outcomes by providing additional treatment options and patient choice. We aimed to describe the availability and prescribing of INJ-BUP for Medicaid beneficiaries since its availability, nationwide and by state.

### Methods

To assess availability, we measured the number of substance use disorder (SUD) facilities that offered INJ-BUP and accepted Medicaid insurance in 2018-2021 and calculated the percentage of all facilities offering medications of OUD. To assess prescribing, we measured the number of prescriptions for INJ-BUP paid by Medicaid 2018-2022 and calculated the percentage of all buprenorphine prescriptions paid by Medicaid. Data sources were publicly available.

### Results

The number of facilities that offered INJ-BUP and accepted Medicaid insurance increased from 360 (2.5% of all SUD facilities offering medication) in 2018 to 2,257 (13.3%) in 2021. The number of prescriptions for INJ-BUP paid by Medicaid increased from 4,322 (0.1% of all buprenorphine prescriptions) in 2018 to 186,861 (2.0%) in 2022. There was notable variability in the number of facilities and prescriptions by state.

### Conclusions

There has been exponential increase in the number of INJ-BUP prescriptions but uptake is much less than observed in other countries in shorter time periods. Limited availability at SUD treatment facilities that accept Medicaid may be one barrier to access.

Keywords: Extended release buprenorphine, injection buprenorphine, Sublocade, Brixadi, Medicaid

## **INTRODUCTION**

In 2017, a monthly buprenorphine injection (INJ-BUP), called Sublocade, was approved by the Food and Drug Administration for the treatment of opioid use disorder (OUD).(1) A second INJ-BUP, with both monthly and weekly dosages, called Brixadi, was approved in May 2023 and became available in September 2023.(2) These extended release formulations of buprenorphine have the potential to positively impact OUD treatment outcomes.(3,4) Compared to oral formulations, INJ-BUP has a greater initial medication dose and consistent bioavailability, reducing the risk of withdrawal symptoms.(5) There is no risk of misuse or diversion, reduced burden of daily medication, and, for some individuals, a periodic injection may reduce negative effects of stigma associated with opioid agonist treatment.(6–8)

Medicaid is the largest payer for behavioral health treatment, including OUD treatment, in the US; thus, Medicaid coverage is important for access and uptake of INJ-BUP. In 2018, INJ-BUP was not covered by Medicaid in 18 states according to a Substance Abuse and Mental Health Services Administration (SAMHSA) report; by 2022, at least 17 of those states reported some coverage (1 was unknown) in a Kaiser Family Foundation Survey of Medicaid Covered Behavioral Health Benefits for Adults.(9,10) Therefore Medicaid covered INJ-BUP in potentially all states within 4 years of approval. Availability of INJ-BUP at substance use disorder (SUD) treatment facilities and INJ-BUP prescriptions paid by Medicaid have not been described since 2019.(4,11) At that time there was limited availability of INJ-BUP at facilities that accepted Medicaid insurance. Here, we describe recent INJ-BUP availability and prescribing for Medicaid beneficiaries.

## **METHODS**

### **Availability**

We analyzed data from National Survey of Substance Abuse Treatment Services (N-SSATS) from 2017-2020(12) and the National Substance Use and Mental Health Services Survey (N-SUMHSS) from

2021.(13) These surveys, conducted by the SAMHSA, collect data on public and private substance abuse treatment facilities in the US. We restricted analysis to facilities that reported offering medications approved for OUD treatment including extended-release naltrexone, methadone, oral buprenorphine (with or with naloxone), INJ-BUP, and the buprenorphine implant (discontinued in 2020). We report the number and percentage of facilities that reported offering each route of buprenorphine and accepting Medicaid insurance, overall and by state. We also calculated the number of facilities per 1000 Medicaid beneficiaries treated for an OUD. For the number of beneficiaries treated for an OUD, we took the average of the numbers reported in the 2019 and 2020 Interactive T-MSIS SUD Date Book (from Table G.2 in the reference).(14)

### **Prescribing**

We analyzed State Drug Utilization Data (SDUD) from 2017-2022.(15) SDUD are reported by states for outpatient medications paid for by state Medicaid agencies. SDUD include the count of prescription fills for each National Drug Code (NDC) by calendar quarter, overall and by state. We identified buprenorphine prescriptions including route using a list of NDCs compiled from the Centers for Disease Control and Prevention's Opioid NDC and Oral MME Conversion File 2017-2020 and the Centers for Medicare and Medicaid Services Chronic Conditions Data Warehouse definition for OUD. In SDUD, counts <11 are suppressed; we imputed suppressed counts with 5.5. We report the total count of prescription fills for each route of buprenorphine, overall and by state. We also calculated the number of prescriptions per 1000 Medicaid beneficiaries treated for an OUD (denominator described above).

## **RESULTS**

### **Availability**

The total number of substance abuse treatment facilities included in the N-SSATS and N-SUMHSS surveys that reported offering any medication for OUD treatment increased from 14,667 in 2018 (the first full year INJ-BUP was approved) to 17,333 in 2021 (Table 1). INJ-BUP was available at 360 facilities that accept Medicaid (2.5% of all SUD facilities offering medication) in 2018. That number increased steadily over the first four years 2,257 (13% of facilities) in 2021. In contrast, the percentage of facilities offering oral buprenorphine and accepting Medicaid increased from 23% to 36%. In 2021, for every 1000 Medicaid beneficiaries with OUD, there were approximately 3.9 facilities offering oral buprenorphine and 1.4 facilities offering INJ-BUP.

Figure 1A depicts the number of facilities in each state by year (numbers provided in Appendix Table 1). In 2018, there were 5 states that did not have a single facility offering INJ-BUP and accepting Medicaid and most states (n=30) had <5 facilities. By 2019, there was just a single state (South Dakota) without any facilities and 7 states with <5. By 2020, all states had at least one facility. The median number of facilities offering INJ-BUP and accepting Medicaid in each state increased from 4 (interquartile range [IQR] 2-9) in 2018 to 29 (IQR 14-67) in 2021 (Table 2). Figure 1B depicts the percentage of facilities offering INJ-BUP and accepting Medicaid (of all SUD facilities offering medication) in each state by year (numbers provided in Appendix Table 2). The median percentage in each state increased from 1.9% (IQR 1.0-3.5) to 12.8 (IQR 8.5-18.9) (Table 2).

## **Prescribing**

Nationwide, there were 4,322 prescriptions for INJ-BUP paid by Medicaid in 2018, the first year it was available (Table 1). The number of prescriptions exponentially increased from 2018 to 2022. In 2022, there were 186,861 prescriptions. In contrast, the number of oral buprenorphine prescriptions increased from 6.4 million in 2018 to 9.1 million in 2022. In 2022, 2.0% of all buprenorphine prescriptions paid by

Medicaid were INJ-BUP. In that year, there were approximately 1.2 prescriptions of INJ-BUP and 56.9 prescriptions of oral buprenorphine per 10 beneficiaries with OUD.

Figure 2A depicts the number of INJ-BUP prescriptions in each state by year (numbers provided in Appendix Table 1). In 2018, there were 13 states with more than 100 prescriptions for INJ-BUP. This number increased to 31 states in 2019, 36 states in 2020, and 40 states in 2021 and 2022. In 2022, 2 states did not report any prescriptions for INJ-BUP (Arkansas and Texas). The median number of prescriptions in each state went from 31 (IQR 11-107) in 2018 to 1786 (IQR 325-3609) in 2022 (Table 2). Figure 2B depicts the proportion of all buprenorphine prescriptions that were for INJ-BUP in each state by year (numbers provided in Appendix Table 2). The median percentage of prescriptions that were for INJ-BUP in each state increased from 0.1% (IQR 0.0%-0.1%) to 1.1% (IQR 0.8%-2.6%) (Table 2).

## DISCUSSION

There has been notable uptake of INJ-BUP among Medicaid beneficiaries, particularly compared to the extended release buprenorphine implant previously.<sup>(4)</sup> However, INJ-BUP is still rare compared to oral buprenorphine. In contrast, in Australia, use of XR buprenorphine was as common as oral buprenorphine just over three years after it became available.<sup>(16)</sup> In Ontario, approximately 6% of people initiating opioid agonist treatment initiated XR buprenorphine just two years after approval.<sup>(17)</sup> In the US, limited availability at SUD treatment facilities that accept Medicaid may be a barrier to access. At present there is little information supporting treatment decisions between INJ-BUP and oral buprenorphine or another MOUD such as XR naltrexone,<sup>(18)</sup> though research suggests that increased treatment options and patient choice can improve treatment adherence and outcomes.<sup>(19)</sup> Limitations of this work include lack of data on access to INJ-BUP in other healthcare settings and INJ-BUP provided in the office settings without a pharmacy fill; both limitations suggest that our results underestimate

availability and prescribing. Characterizing and ultimately eliminating barriers to INJ-BUP access are key to leveraging this novel modality to improve OUD outcomes.

**Figure 1.** Substance use disorder treatment facilities that offered buprenorphine injection and accepted Medicaid insurance: absolute number (A) and as a percentage of all facilities offering medication for opioid use disorder (B). In each panel states are sorted by statistic in 2021. Arrows indicate that value exceeds the x-axis upper limit and are shown in the inset table. \* marks states without Medicaid coverage for buprenorphine injection in 2018.

**Figure 2.** Prescription for buprenorphine injection paid by Medicaid: absolute number (A) and as a percentage of all buprenorphine prescriptions for opioid use disorder. In each panel states are sorted by statistic in 2022. Arrows indicate that value exceeds the x-axis upper limit and are shown in the inset table. \* marks states without Medicaid coverage for buprenorphine injection in 2018.
