screening programs, advising women to begin screening between the ages of 40 and 50
(Arefan et al., 2020). Digital mammography is commonly now address the many developed countries the map entire many experts the ages of 40 and 50 (Arefan et al., 2020). Digital mammography is commonly now used for early detection, and assessing mammographic density is a crucial as

Screening programs, advised to the argument and government in a ages of the anti-order (Arefan et al., 2020). Digital mammography is commonly now used for early detection, and assessing mammographic density is a crucial as (Arefan et al., 2021). Mammographic density is a crucial aspect of this process.

Mammographic (of breast) density is the defined in terms of the regions on a mammogram

that are "white or bright", as distinct from dark. I Mammographic (of breast) density is the defined in terms of the re
that are "white or bright", as distinct from dark. It is presume
represent glandular and connective tissue rather than fatty tissue. N
assessed only throug Mat are "white or bright", as distinct from dark. It is presumed that the dense areas
represent glandular and connective tissue rather than fatty tissue. Mammographic density is
assessed only through mammographic imaging a

represent glandular and connective tissue rather than fatty tissue. Mammographic density is
assessed only through mammographic imaging and is not related to the way the breasts feel.
Mammographic density poses challenges i repressed only through mammographic imaging and is not related to the way the breasts feel.
Mammographic density poses challenges in breast cancer detection. Dense breast tissue
appears white on mammograms, similar to canc Mammographic density poses challenges in breast cancer detection. Dense breast tissue
appears white on mammograms, similar to cancerous tissue, making it more challenging to
detect tumors during routine screening (Nazari & Mappears white on mammograms, similar to cancerous tissue, making it more challenging to
detect tumors during routine screening (Nazari & Mukherjee, 2018). This similarity increases
the chances of false negatives, where ca appears which starting paints, similar (Nazari & Mukherjee, 2018). This similarity increases
the chances of false negatives, where cancers are missed in mammograms. Consequently,
women with dense breasts might benefit from detect tumors analysts and visition is created in manufacture. The shanes of false negatives, where cancers are missed in mammograms. Consequently, women with dense breasts might benefit from additional imaging tests, such the chances of false negatives, where the chance in additional imaging tests, such as ultrasound
or magnetic resonance imaging (MRI), to ensure early detection and accurate diagnosis (Grin
et al., 2009). In this regard, fo woman with dense breasts might be early detection and accurate diagnosis (Grin
et al., 2009). In this regard, fortunately mammographic density decreases with increasing
age and with increasing body size (such as body mass or magnetic resonance imaging (MRI), to entity the consistent accurate angular (Find
et al., 2009). In this regard, fortunately mammographic density decreases with increasing
age and with increasing body size (such as body age and with increasing body size (such as body mass index (BMI) or breast size), making
screening more effective for older women.
The mass index (BMI) or breast size), making age and with increasing body size (such as body mass in the set of the state), making size of the state o screening more effective for older women.

breast cancer for screening-aged women. This appears to be paradoxical given that age and
BMI are both associated with increasing breast risk for this specific population.
Nevertheless, these associations exist even after BMI are both associated with increasing breast risk for this specific population.
Nevertheless, these associations exist even after adjusting for age and BMI, irrespective of
how density is measured (D'Orsi et al., 2018; E BONITY INTERT THE TRANSIST THE TRANSIST THE TRANSIST THE TRANSIS THE MEXIST THE AND A donst density is measured (D'Orsi et al., 2018; Engmann et al., 2017; McCormack & dos Santos Silva, 2006) (Lu et al., 2022)). Either way Nevertheless, these area (D'Orsi et al., 2018; Engmann et al., 2017; McCormack & dos
Santos Silva, 2006) (Lu et al., 2022)). Either way, the risk association is stronger for 'interval'
cancers diagnosed in the next two or Santos Silva, 2006) (Lu et al., 2022)). Either way, the risk association is stronger for 'interval'
cancers diagnosed in the next two or three years (Nguyen et al., Breast Cancer Res 2018)),
thought to be at least in part

cancers diagnosed in the next two or three years (Nguyen et al., Breast Cancer Res 2018)),
thought to be at least in part due the role of masking existing cancers mentioned above.
There are a variety of approaches to measu thought to be at least in part due the role of masking existing cancers mentioned above.
There are a variety of approaches to measurement including quantitative, semi-automated
and automated approaches. One qualitative app There are a variety of approaches to measurement including quantitative, semi-automand automated approaches. One qualitative approach is the BI-RADS density categorisa

the correlation between the correlation between the correlation between the correlation between the correlation

percent density values for the left and right breasts (bilateral comparison). This correlation is
illustrated in Figure 3.A and 3.B, where percent density was measured using AutoCumulus illustrated in Figure 3.A and 3.B, where percent density was measured using AutoCumulus and LIBRA, respectively. Figure 3.A shows that the correlation between measures for the left and right breast had a correlation of 0.95 when using AutoCumulus, greater than 0.79 when using the LIBRA software (P<0.001).

Figure 2: A) Correlation between the automated percent density estimated by AutoCumulus and the corresponding actual measures, B) the Bland-Altman plot, which assess the agreement between the estimated percent density and the corresponding actual measures.

Figure 3: Correlation analysis depicting the relationship between percent density measurements for the left and right breasts using A) AutoCumulus and B) LIBRA.

Figure 4 shows the performance of the average percent density across left and right breasts
as a predictor of interval cancer was stronger when using AutoCumulus than LIBRA (AUC = as a predictor of interval cancer was stronger when using AutoCumulus than LIBRA (AUC = 0.638 (p<0.001) versus 0.597 (p<0.001)). Importantly, performance was better at high levels of specificity (e.g. 95%, equivalent to a low false positive rate of 5%), for which the true positive was 13% for AutoCulumulus and 10% for LIBRA (p<0.001).

Figure 4 illustrates the (ROC) curves and corresponding (AUC) values for AutoCumulus and Libra as predictors of interval cancer.

We have demonstrated how an automated algorithm for measuring mammographic density can be learnt by applying AI to human-derived measures based on a semi-automated approach using the CUMULUS software. Our approach was validated using an independent dataset form which we found that our automated measure, AutoCumulus, provided more repeatable measures and could predict interval cancers better than the freely available and widely used automated tool LIBRA. One reason behind this could be that AutoCumulus measures were much more strongly correlated between a woman's left and right breasts.

There is a well-established association between mammographic density and risk of interval cancers that are diagnosed between regular mammographic screens (Kerlikowske et al., 2015; Strand et al., 2019), and there is a wide concern about 'dense breasts' per se (REF). Measurement of density has been problematic, however, and clinical practice has generally relied on the pathologists' interpretation without any formal quality control; the risk predicting performance of the BI-RADS categorisations when used in practice by multiple one or a few radiologists (Hopper et al., 2020). The specialist semi-automated measure,
CUMULUS, is used in many research papers but does not appear to be used in clinical
practice. Automated measures such as VOLPARA and L CUMULUS, is used in many research papers but does not appear to be used in clinical
practice. Automated measures such as VOLPARA and LIBRA have been developed and are
being used in clinical and research settings.
Strengths
