Cohort Definitions

OHDSI's ATLAS (<https://www.ohdsi.org/web/atlas>) is an open-source software tool for researchers to conduct scientific analyses on standardized observational data converted to the OMOP Common Data Model v5. Researchers can create cohorts by defining groups of people based on an exposure to a drug or diagnosis of a particular condition using healthcare claims data. ATLAS has vocabulary searching of medical concepts to identify people with specific conditions, drug exposures, etc. Patient profiles can be viewed within a specific cohort allowing visualization of a particular subject's health care records. Population effect level estimation analyses allow for comparing two different cohorts and leverage R packages. Here we have described the cohort definition for dipeptidyl peptidase-4 inhibitors (DPP4is) new users. The same method has been applied for defining cohorts of sodium-glucose co-transporter-2 inhibitors (SGLT2is), glucagon-like peptide-1 receptor agonists (GLP1-RAs), and sulfonylureas (SUs) new users.

I. **Class-vs-Class Exposure (DPP4is New-User) Cohort / OT1**

i. **Cohort Entry Events**

People with continuous observation of 365 days before the event may enter the cohort when observing any of the following:

1. drug exposure of 'DPP4 inhibitors' for the first time in the person's

history. Limit cohort entry events to the earliest event per person.

Restrict entry events to with all of the following criteria:

1. with the following event criteria: who are ≥ 18 years old.
2. having at least 1 condition occurrence of 'Type 2 diabetes mellitus,' starting anytime on or before cohort entry start date; allow events outside observation period.
3. having no condition occurrences of 'Type 1 diabetes mellitus,' starting anytime on or before cohort entry start date; allow events outside observation period.
4. having no condition occurrences of 'Secondary diabetes mellitus,' starting anytime on or before cohort entry start date; allow events outside observation period.

ii. **Additional Inclusion Criteria**

1. No prior GLP-1 receptor agonist exposure

Entry events having no drug exposures of 'GLP-1 receptor agonists,' starting anytime on or before cohort entry start date; allow events outside observation period.

2. No prior SGLT-2 inhibitor exposure

Entry events having no drug exposures of 'SGLT2 inhibitors,' starting anytime on or before cohort entry start date; allow events outside observation period.

3. No prior SU exposure

Entry events having no drug exposures of 'Sulfonylureas,' starting anytime on or before cohort entry start date; allow events outside observation period.

4. No prior other anti-diabetic exposure

Entry events having no drug exposures of 'Other anti-diabetics,' starting anytime on or before cohort entry start date; allow events outside observation period.

5. Prior metformin use

Entry events with any of the following criteria:

1. having at least 1 drug era of 'Metformin,' starting anytime up to 90 days before cohort entry start date; allow events outside observation period; with era length \geq 90 days.
 2. having at least 3 drug exposures of 'Metformin,' starting anytime on or before cohort entry start date; allow events outside observation period.
- No prior insulin use or combo initiation: Proxy for $<$ 30 days drug era anytime before index and no combination use on index

Entry events with all of the following criteria:

1. having no drug eras of 'Insulin,' starting anytime up to 30 days before cohort entry start date; allow events outside observation period; with era length $>$ 30 days.
2. having no drug eras of 'Insulin,' starting between 30 days before and 0 days after cohort entry start date; allow events outside observation period.

6. Higher cardiovascular risk

Entry events with any of the following criteria:

1. having at least 1 condition occurrence of 'Conditions indicating established cardio-vascular disease,' starting anytime on or before cohort entry start date; allow events outside observation period.
2. having at least 1 procedure occurrence of 'Procedures indicating established cardio-vascular disease,' starting anytime on or before cohort entry start date; allow events outside observation period.

Concept: Conditions indicating established cardiovascular disease

II. Metformin Use Modifier

i. No prior metformin use

Entry events having no drug eras of 'Metformin,' starting anytime on or before cohort entry start date; allow events outside observation period.

III. Heterogeneity Study Inclusion Criteria

i. Lower age group

Entry events with the following event criteria: who are < 45 years old.

ii. Middle age group

Entry events with all of the following criteria:

1. with the following event criteria: who are \geq 45 years old.
2. with the following event criteria: who are < 65 years old.

iii. Older age group

Entry events with the following event criteria: who are \geq 65 years old.

iv. Female stratum

Entry events with the following event criteria: who are female.

v. Male stratum

Entry events with the following event criteria: who are male.

vi. Race stratum

Entry events with the following event criteria: race is: "black or african american," "black," "african american," "african," "bahamian," "barbadian," "dominican," "dominica islander," "haitian," "jamaican," "tobagoan," "trinidadian" or "west indian."

V. Escalation Exit Criteria

The cohort end date will be based on a continuous exposure to 'DPP4 inhibitors': allowing 30 days between exposures, adding 0 days after exposure ends, and using days supply and exposure end date for exposure duration.

The person also exits the cohort when encountering any of the following events:

1. drug exposures of 'All alternative target exposures.'
2. drug exposures of 'Other anti-diabetics.'
3. drug eras of 'Insulin,' with era length > 30 days.

i. Concept: All alternative target exposures

Study Outcomes

We have assessed 3-point major adverse cardiovascular events (MACE) and 4-point MACE as the primary study outcomes, where 3-point (MACE) includes acute myocardial infarction, stroke, and sudden cardiac death; and 4-point MACE additionally includes hospitalization for heart failure. Secondary outcomes of interest include the four individual MACE components as defined below.

Acute Myocardial Infarction

Cohort Entry Events

People may enter the cohort when observing any of the following:

1. condition occurrences of '[LEGEND-T2DM] Acute myocardial Infarction'.

Restrict entry events to having at least 1 visit occurrence of 'Inpatient or ER visit', starting anytime on or before cohort entry start date and ending between 0 days before and all days after cohort entry start date.

Cohort Exit

The cohort end date will be offset from index event's start date plus 7 days.

Cohort Eras

Entry events will be combined into cohort eras if they are within 180 days of each other.

Concept Set Definitions

1. Inpatient or ER visit

Concept ID	Concept Name	Domain	Vocabulary	Excluded	Descendants	Mapped
262	Emergency Room and Inpatient Visit	Visit	Visit	NO	YES	NO
9203	Emergency Room Visit	Visit	Visit	NO	YES	NO
9201	Inpatient Visit	Visit	Visit	NO	YES	NO

2. Acute myocardial infarction

Concept ID	Concept Name	Domain	Vocabulary	Excluded	Descendants	Mapped
4329847	Myocardial infarction	Condition	SNOMED	NO	YES	NO
314666	Old myocardial infarction	Condition	SNOMED	YES	YES	NO

Stroke

Cohort Entry Events

People may enter the cohort when observing any of the following:

1. condition occurrences of '[LEGEND-T2DM] Stroke (ischemic or hemorrhagic)'.

Restrict entry events to having at least 1 visit occurrence of 'Inpatient or ER visit', starting between all days before and 1 days after cohort entry start date and ending between 0 days before and all days after cohort entry start date.

Cohort Exit

The cohort end date will be offset from index event's start date plus 7 days.

Cohort Eras

Entry events will be combined into cohort eras if they are within 180 days of each other.

Concept Set Definitions

1. Inpatient or ER visit

Concept ID	Concept Name	Domain	Vocabulary	Excluded	Descendants	Mapped
262	Emergency Room and Inpatient Visit	Visit	Visit	NO	YES	NO

4148906	Spontaneous subarachnoid hemorrhage	Condition	SNOMED	NO	NO	NO

Sudden Cardiac Death

Cohort Entry Events

People may enter the cohort when observing any of the following:

1. condition occurrences of '[LEGEND HTN] Sudden cardiac death'.

Restrict entry events to having at least 1 visit occurrence of 'Inpatient or ER visit', starting anytime on or before cohort entry start date and ending between 0 days before and all days after cohort entry start date.

Cohort Exit

The cohort end date will be offset from index event's start date plus 7 days.

Cohort Eras

Entry events will be combined into cohort eras if they are within 180 days of each other.

Concept Set Definitions

1. Inpatient or ER visit

Concept ID	Concept Name	Domain	Vocabulary	Excluded	Descendants	Mapped
262	Emergency Room and Inpatient Visit	Visit	Visit	NO	YES	NO
9203	Emergency Room Visit	Visit	Visit	NO	YES	NO
9201	Inpatient Visit	Visit	Visit	NO	YES	NO

2. Sudden cardiac death

Concept ID	Concept Name	Domain	Vocabulary	Excluded	Descendants	Mapped
4048809	Brainstem death	Condition	SNOMED	NO	YES	NO
321042	Cardiac arrest	Condition	SNOMED	NO	YES	NO
442289	Death in less than 24 hours from onset of symptoms	Condition	SNOMED	NO	YES	NO
4317150	Sudden cardiac death	Condition	SNOMED	NO	YES	NO
4132309	Sudden death	Condition	SNOMED	NO	YES	NO
437894	Ventricular fibrillation	Condition	SNOMED	YES	YES	NO

Heart Failure Hospitalization

Cohort Entry Events

People may enter the cohort when observing any of the following:

1. visit occurrences of 'Inpatient or ER visit'; having at least 1 condition occurrence of '[LEGEND-T2DM] Heart Failure', starting between 0 days before and all days after 'Inpatient or ER visit' start date and starting anytime on or before 'Inpatient or ER visit' end date.

Cohort Exit

The cohort end date will be offset from index event's end date plus 0 days.

Cohort Eras

Entry events will be combined into cohort eras if they are within 7 days of each other.

Concept Set Definitions

1. Inpatient or ER visit

Concept ID	Concept Name	Domain	Vocabulary	Excluded	Descendants	Mapped
262	Emergency Room and Inpatient Visit	Visit	Visit	NO	YES	NO
9203	Emergency Room Visit	Visit	Visit	NO	YES	NO
9201	Inpatient Visit	Visit	Visit	NO	YES	NO

2. Heart Failure

Concept ID	Concept Name	Domain	Vocabulary	Excluded	Descendants	Mapped
315295	Congestive rheumatic heart failure	Condition	SNOMED	YES	YES	NO
316139	Heart failure	Condition	SNOMED	NO	YES	NO

Negative Control Outcomes

We selected negative controls using a process similar to that outlined in Voss et al. [1]. We first constructed a list of all conditions that satisfy the following criteria with respect to all drug exposures in the LEGEND-HTN study [2]:

- No Medline abstract where the MeSH terms suggests a drug-condition association [3],
- No mention of the drug-condition pair on a US product label in the “Adverse Drug Reactions” or “Postmarketing” section [4],
- No US spontaneous reports suggesting that the pair is in an adverse event relationship [5, 6],
- OMOP vocabulary does not suggest that the drug is indicated for the condition,
- Vocabulary conditional concepts are usable (i.e., not too broad, not suggestive of an adverse event relationship, no pregnancy related), and
- Exact condition concept itself is used in patient level data.

We then optimized the remaining condition concepts, such that parent concepts remove children as defined by the OMOP vocabulary and performed manual review to exclude any pairs that may still be in a causal relationship or too similar to the study outcome. This process led to a candidate list of 100 negative controls (**Supplementary Table 4**).

Supplementary Table 1: Description of databases from the observational health data sciences and informatics network included in the study.

Name of Database	Abbreviation	Type of Data	Country of Origin	Years of Exposure Included
IBM MarketScan® Commercial Claims and Encounters Data (CCAЕ)	CCAЕ	Claims Data	USA	2011-2021
Germany Disease Analyser	GDA	EHR Data	Germany	1992-2021
UK-IQVIA Medical Research Data	IMRD	EHR Data	United Kingdom	2011-2019
IBM Health MarketScan® Multi-State Medicaid Database	MDCD	Claims Data	USA	2011-2020
IBM Health MarketScan® Medicare Supplemental and Coordination of Benefits Database	MDCR	Claims Data	USA	2011-2021
Optum© Clinformatics Extended Data Mart - Date of Death (DOD)	OCEDM	Claims Data	USA	2011-2021
Optum© de-identified Electronic Health Record Dataset	OEHR	Claims Data	USA	2011-2021
Information System for Research in Primary Care	SIDIAP	EHR Data	Spain	2011-2021
US Open Claims	USOC	Claims Data	USA	2000-2021
Department of Veterans Affairs Healthcare System	VA	EHR Data	USA	2011-2021

Supplementary Table 2: Brief descriptions of databases from the observational health data sciences and informatics network included in the study.

Name of Database	Abbreviation	Brief Description
US National Databases		
IBM MarketScan® Commercial Claims and Encounters Data	CCAЕ	IBM Health MarketScan® Commercial Claims and Encounters Database (CCAЕ) represent data from individuals enrolled in United States employer-sponsored insurance health plans. The data includes adjudicated health insurance claims (e.g. inpatient, outpatient, and outpatient pharmacy) as well as enrollment data from large employers and health plans who provide private healthcare coverage to employees, their spouses, and dependents. Additionally, it captures laboratory tests for a subset of the covered lives. This administrative claims database includes a variety of fee-for-service, preferred provider organizations, and capitated health plans.
IBM Health MarketScan® Multi-State Medicaid Database	MDCD	IBM MarketScan® Multi-State Medicaid Database (MDCD) adjudicated US health insurance claims for Medicaid enrollees from multiple states and includes hospital discharge diagnoses, outpatient diagnoses and procedures, and outpatient pharmacy claims as well as ethnicity and Medicare eligibility. Members maintain their same identifier even if they leave the system for a brief period however the dataset lacks lab data.
IBM Health MarketScan Medicare Supplemental and Coordination of Benefits Database	MDCR	IBM Health MarketScan® Medicare Supplemental and Coordination of Benefits Database (MDCR) represents health services of retirees in the United States with primary or Medicare supplemental coverage through privately insured fee-for-service, point-of-service, or capitated health plans. These data include adjudicated health insurance claims (e.g. inpatient, outpatient, and outpatient pharmacy). Additionally, it captures laboratory tests for a subset of the covered lives.
Optum Clinformatics Extended Data Mart - Date of Death (DOD)	OCEDM	Optum Clinformatics Extended DataMart is an adjudicated US administrative health claims database for members of private health insurance, who are fully insured in commercial plans or in administrative services only (ASOs), Legacy Medicare Choice Lives (prior to January 2006), and Medicare Advantage (Medicare Advantage Prescription Drug coverage starting January 2006). The population is primarily representative of commercial claims patients (0-65 years old) with some Medicare (65+ years old) however ages are capped at 90 years. It includes data captured from administrative claims processed from inpatient and outpatient medical services and prescriptions as dispensed, as well as results for outpatient lab tests processed by large national lab vendors who participate in data exchange with Optum. This dataset also provides date of death (month and year only) for members with both medical and pharmacy coverage from the Social Security Death Master File (however after 2011 reporting frequency changed due to changes in reporting requirements) and location information for patients is at the US state level.
Optum© de-identified Electronic Health Record Dataset	OEHR	Optum© de-identified Electronic Health Record Dataset represents Humedica’s Electronic Health Record data a medical records database. The medical record data includes clinical information, inclusive of prescriptions as prescribed and administered, lab results, vital signs, body measurements, diagnoses, procedures, and information derived from clinical Notes using Natural Language Processing (NLP).

Name of Database	Abbreviation	Brief Description
US Open Claims	USOC	US Open Claims is a United States database of open, pre-adjudicated claims from 2000 to present. Data are reported at anonymized patient level collected from office-based physicians and specialists via office management software and clearinghouse switch sources for the purpose of reimbursement. A subset of medical claims data has adjudicated claims.
US Health System Databases		
Department of Veterans Affairs health care system	VA	VA OMOP data reflects the national Department of Veterans Affairs health care system, which is the largest integrated provider of medical and mental health services in the United States. Care is provided at 170 VA Medical Centers and 1,063 outpatient sites serving more than 9 million enrolled Veterans each year.
Non-US Databases		
Germany Disease Analyser	GDA	Germany Disease Analyser is collected from extracts of patient management software used by general practitioners and specialists practicing in ambulatory care settings. Data coverage includes 40.2 million distinct person records, about 48.2% population in the country and collected from 2,800 providers. Patient visiting more than one provider are not cross identified for data protection reasons and therefore recorded as separate in the system. Dates of service include from 1992 through present. Observation time is defined by the first and last consultation dates. Germany has no mandatory general practitioner system and patient have free choice of specialist. Drugs are recorded as prescriptions of marketed products. No registration or approval is required for drug utilization studies.
Information System for Research in Primary Care	SIDIAP	The Information System for Research in Primary Care (SIDIAP; www.sidiap.org) is a primary care records database that covers approximately 80% of the population of Catalonia, North-East Spain. Healthcare is universal and tax-payer funded in the region, and primary care physicians are gatekeepers for all care and responsible for repeat prescriptions. For this study, SIDIAP was linked to the Minimum Basic Dataset (CMBD), a national population-based registry that includes hospital discharge information of mandatory registration.
UK-IQVIA Medical Research Data	IMRD	The UK-IQVIA Medical Research Data (IMRD), previously known as The Health Improvement Network (THIN), contains anonymized electronic health records from over 744 general practices in the UK, covering approximately 6% of the UK population. It contains data on prescriptions, diagnoses, referrals, and patient demographics broadly representative of the UK.

Supplementary Table 3: Pharmacological agents included in the drug classes.

GLP1-RA	SGLT2i	DPP4i	SU
Albiglutide	Canagliflozin	Alogliptin	Chlorpropamide
Dulaglutide	Dapagliflozin	Linagliptin	Glimepiride
Exenatide	Empagliflozin	Saxagliptin	Glipizide
Liraglutide	Ertugliflozin	Sitagliptin	Gliquidone
Lixisenatide		Vildagliptin	Glyburide
Semaglutide			Tolazamide
			Tolbutamide

Supplementary Table 4: Negative control outcomes.

Condition Concept
Abnormal posture
Abrasion and/or friction burn of multiple sites
Absent kidney
Anomaly of jaw size
Benign paroxysmal positional vertigo
Bizarre personal appearance
Cachexia
Colostomy present
Complication of gastrostomy
Developmental delay
Deviated nasal septum
Epidermoid cyst
Exhaustion due to excessive exertion
Feces contents abnormal
Foreign body in ear
Foreskin deficient
Galactosemia
Ganglion cyst
Genetic disorder carrier
Impacted cerumen
Inadequate sleep hygiene
Jellyfish poisoning
Lagophthalmos
Lipid storage disease
Lymphangioma
Malingering
Marfan's syndrome
Mechanical complication of internal orthopedic device, implant AND/OR graft
Minimal cognitive impairment
Nicotine dependence
Nonspecific tuberculin test reaction
Opioid abuse
Opioid intoxication
Physiological development failure
Poisoning by tranquilizer
Social exclusion
Symbolic dysfunction
Tooth loss
Toxic effect of lead compound
Toxic effect of tobacco and nicotine
Tracheostomy present
Unsatisfactory tooth restoration
Abnormal pupil
Abrasion and/or friction burn of trunk without infection
Absence of breast
Acquired hallux valgus
Acquired keratoderma
Anal and rectal polyp
Burn of forearm

Calcaneal spur
Cannabis abuse
Changes in skin texture
Chondromalacia of patella
Cocaine abuse
Complication due to Crohn's disease
Contact dermatitis
Contusion of knee
Crohn's disease
Derangement of knee
Difficulty sleeping
Disproportion of reconstructed breast
Effects of hunger
Endometriosis
Feces contents abnormal
Foreign body in orifice
Ganglion cyst
Hammer toe
Hereditary thrombophilia
High risk sexual behavior
Homocystinuria
Impacted cerumen
Impingement syndrome of shoulder region
Ingrowing nail
Injury of knee
Kwashiorkor
Late effect of contusion
Late effect of motor vehicle accident
Macular drusen
Melena
Nicotine dependence
Noise effects on inner ear
Non-toxic multinodular goiter
Nonspecific tuberculin test reaction
Opioid abuse
Passing flatus
Postviral fatigue syndrome
Presbyopia
Psychalgia
Ptotic breast
Regular astigmatism
Senile hyperkeratosis
Somatic dysfunction of lumbar region
Splinter of face without major open wound
Sprain of ankle
Strain of rotator cuff capsule
Tear film insufficiency
Tobacco dependence syndrome
Verruca vulgaris
Wrist joint pain
Wristdrop

Supplementary Table 5: Baseline patient characteristics for SGLT2is (T) and GLP1-RAs (C) new-users in the CCAE data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Characteristic	Before adjustment			After matching			After stratification		
	T (%)	C (%)	StdDiff	T (%)	C (%)	StdDiff	T (%)	C (%)	StdDiff
Age group

Supplementary Table 7: Baseline patient characteristics for SGLT2is (T) and GLP1-RAs (C) new-users in the MDCR data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Supplementary Table 11: Baseline patient characteristics for SGLT2is (T) and DPP4is (C) new-users in the GermanyDA data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Supplementary Table 13: Baseline patient characteristics for SGLT2is (T) and DPP4is (C) new-users in the MDCR data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Supplementary Table 15: Baseline patient characteristics for SGLT2is (T) and DPP4is (C) new-users in the Open Claims data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Supplementary Table 17: Baseline patient characteristics for SGLT2is (T) and DPP4is (C) new-users in the SIDIAP data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Supplementary Table 19: Baseline patient characteristics for SGLT2is (T) and SUs (C) new-users in the CCAE data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Supplementary Table 21: Baseline patient characteristics for SGLT2is (T) and SUs (C) new-users in the OptumDOD data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Characteristic	Before adjustment			After matching			After stratification

Supplementary Table 24: Baseline patient characteristics for SGLT2is (T) and SUs (C) new-users in the Open Claims data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Supplementary Table 26: Baseline patient characteristics for SGLT2is (T) and SUs (C) new-users in the SIDIAP data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Supplementary Table 28: Baseline patient characteristics for GLP1-RAs (T) and DPP4is (C) new-users in the CCAE data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Supplementary Table 30: Baseline patient characteristics for GLP1-RAs (T) and DPP4is (C) new-users in the MDCR data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Supplementary Table 34: Baseline patient characteristics for GLP1-RAs (T) and SUs (C) new-users in the Optum-DOD data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Supplementary Table 36: Baseline patient characteristics for GLP1-RAs (T) and SUs (C) new-users in the Open Claims data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Supplementary Table 38: Baseline patient characteristics for DPP4is (T) and SUs (C) new-users in the CCAE data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Supplementary Table 40: Baseline patient characteristics for DPP4is (T) and SUs (C) new-users in the OptumDOD data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Supplementary Table 47: Baseline patient characteristics for DPP4is (T) and SUs (C) new-users in the VA data source. We report proportion of initiators satisfying selected base-line characteristics and the standardized difference of population proportions (StdDiff) before and after propensity score adjustment. Less extreme StdDiffs through matching and stratification suggest improved balance between patient cohorts through adjustment.

Supplementary Table 49: Exposures, outcomes and risk estimates for 3-point MACE in SGLT2is (T) vs GLP1-RAs (C) new-user cohorts under two different propensity score (PS) adjustment / time-at-risk (TAR) designs across data sources. We report total patient exposure time in 1,000 patient-year (KYr) units, uncalibrated and calibrated hazard ratios (HRs) and their 95% confidence intervals (CIs). Greyed out entries did not pass study diagnostics and are included only for completeness.

Supplementary Table 55: Exposures, outcomes and risk estimates for 4-point MACE in SGLT2is (T) vs GLP1-RAs (C) new-user cohorts under two different propensity score (PS) adjustment / time-at-risk (TAR) designs across data sources. We report total patient exposure time in 1,000 patient-year (KYr) units, uncalibrated and calibrated hazard ratios (HRs) and their 95% confidence intervals (CIs). Greyed out entries did not pass study diagnostics and are included only for completeness.

Supplementary Table 75: Exposures, outcomes and risk estimates for Sudden cardiac death in SGLT2is (T) vs SUs (C) new-user cohorts under two different propensity score (PS) adjustment / time-at-risk (TAR) designs across data sources. We report total patient exposure time in 1,000 patient-year (KYr) units, uncalibrated and calibrated hazard ratios (HRs) and their 95% confidence intervals (CIs). Greyed out entries did not pass study diagnostics and are included only for completeness.

Supplementary Figure 1: Preference score distributions comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in CCAE. The preference score is a transformation of the propensity score that adjusts for prevalence differences between populations. For each class pair, we fit a large-scale propensity score model using >40,000 baseline patient characteristics. A higher overlap between score distributions indicates that patients in the target (left, red) and comparator (bottom, blue) populations are more similar in terms of their predicted probability of receiving one treatment over the other. We define clinical empirical equipoise when a majority of patients in both populations carry preference scores between 0.3 and 0.7.

Supplementary Figure 2: Preference score distributions comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in GDA. The preference score is a transformation of the propensity score that adjusts for prevalence differences between populations. For each class pair, we fit a large-scale propensity score model using >40,000 baseline patient characteristics. A higher overlap between score distributions indicates that patients in the target (left, red) and comparator (bottom, blue) populations are more similar in terms of their predicted probability of receiving one treatment over the other. We define clinical empirical equipoise when a majority of patients in both populations carry preference scores between 0.3 and 0.7.

Supplementary Figure 3: Preference score distributions comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in OptumDOD. The preference score is a transformation of the propensity score that adjusts for prevalence differences between populations. For each class pair, we fit a large-scale propensity score model using >40,000 baseline patient characteristics. A higher overlap between score distributions indicates that patients in the target (left, red) and comparator (bottom, blue) populations are more similar in terms of their predicted probability of receiving one treatment over the other. We define clinical empirical equipoise when a majority of patients in both populations carry preference scores between 0.3 and 0.7.

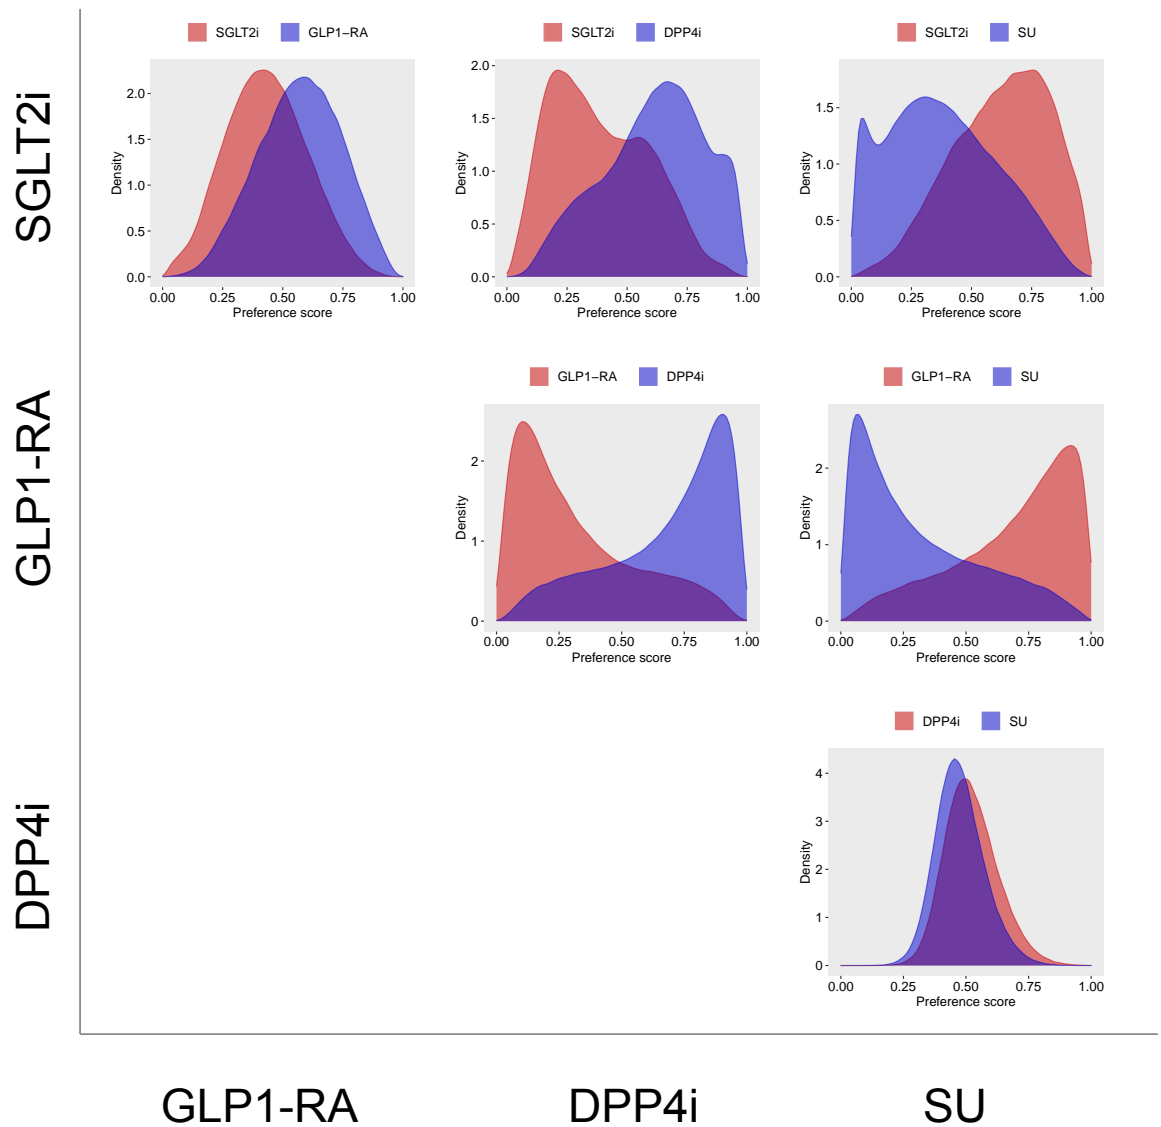

Supplementary Figure 4: Preference score distributions comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in MDCR. The preference score is a transformation of the propensity score that adjusts for prevalence differences between populations. For each class pair, we fit a large-scale propensity score model using >40,000 baseline patient characteristics. A higher overlap between score distributions indicates that patients in the target (left, red) and comparator (bottom, blue) populations are more similar in terms of their predicted probability of receiving one treatment over the other. We define clinical empirical equipoise when a majority of patients in both populations carry preference scores between 0.3 and 0.7.

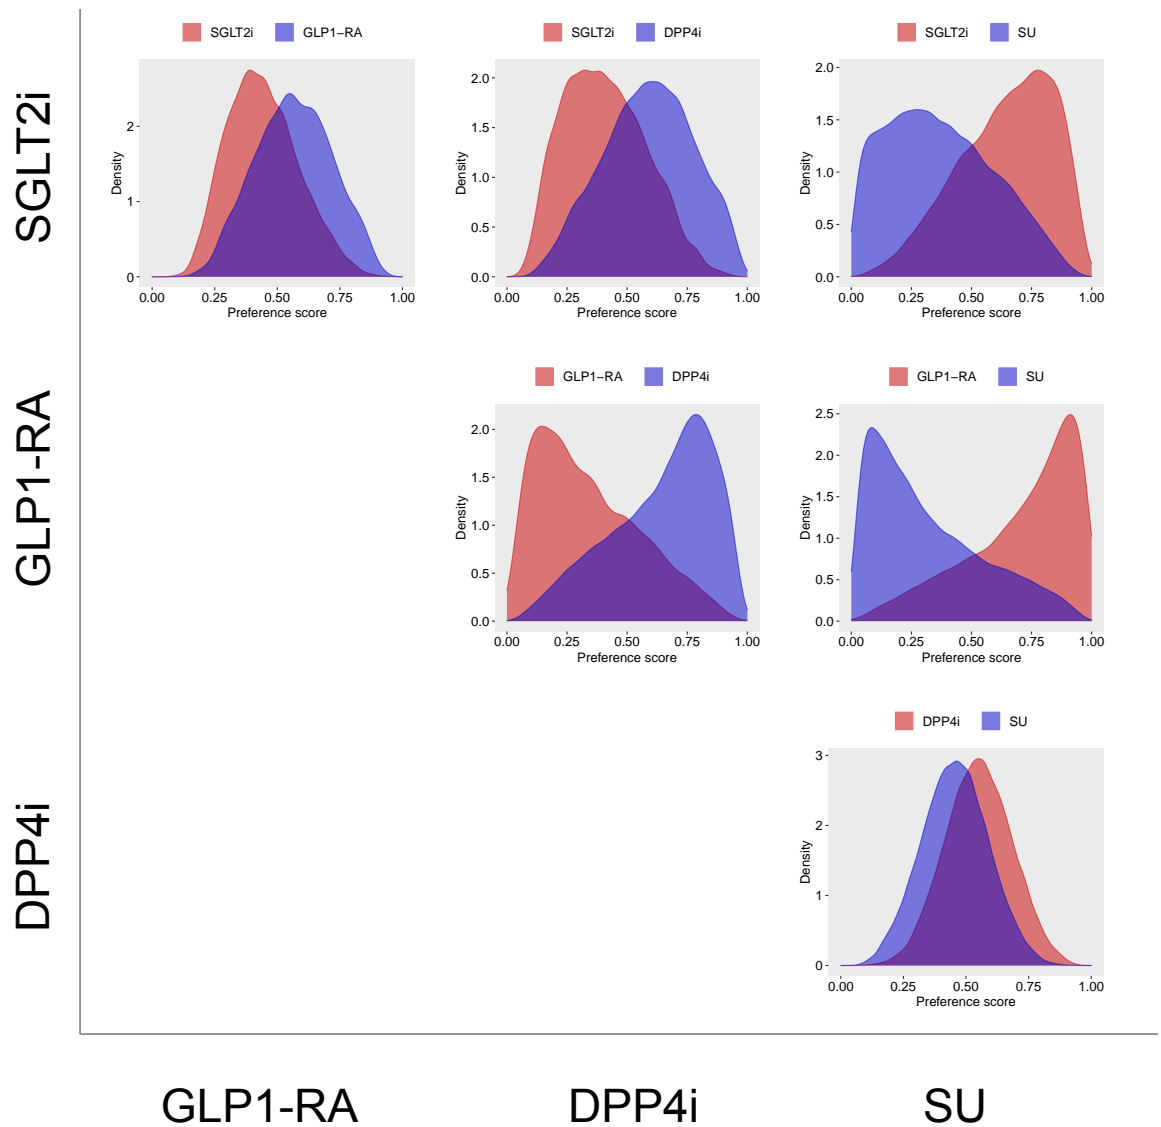

Supplementary Figure 5: Preference score distributions comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in MDCD. The preference score is a transformation of the propensity score that adjusts for prevalence differences between populations. For each class pair, we fit a large-scale propensity score model using >40,000 baseline patient characteristics. A higher overlap between score distributions indicates that patients in the target (left, red) and comparator (bottom, blue) populations are more similar in terms of their predicted probability of receiving one treatment over the other. We define clinical empirical equipoise when a majority of patients in both populations carry preference scores between 0.3 and 0.7.

Supplementary Figure 6: Preference score distributions comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in IMRD. The preference score is a transformation of the propensity score that adjusts for prevalence differences between populations. For each class pair, we fit a large-scale propensity score model using >40,000 baseline patient characteristics. A higher overlap between score distributions indicates that patients in the target (left, red) and comparator (bottom, blue) populations are more similar in terms of their predicted probability of receiving one treatment over the other. We define clinical empirical equipoise when a majority of patients in both populations carry preference scores between 0.3 and 0.7.

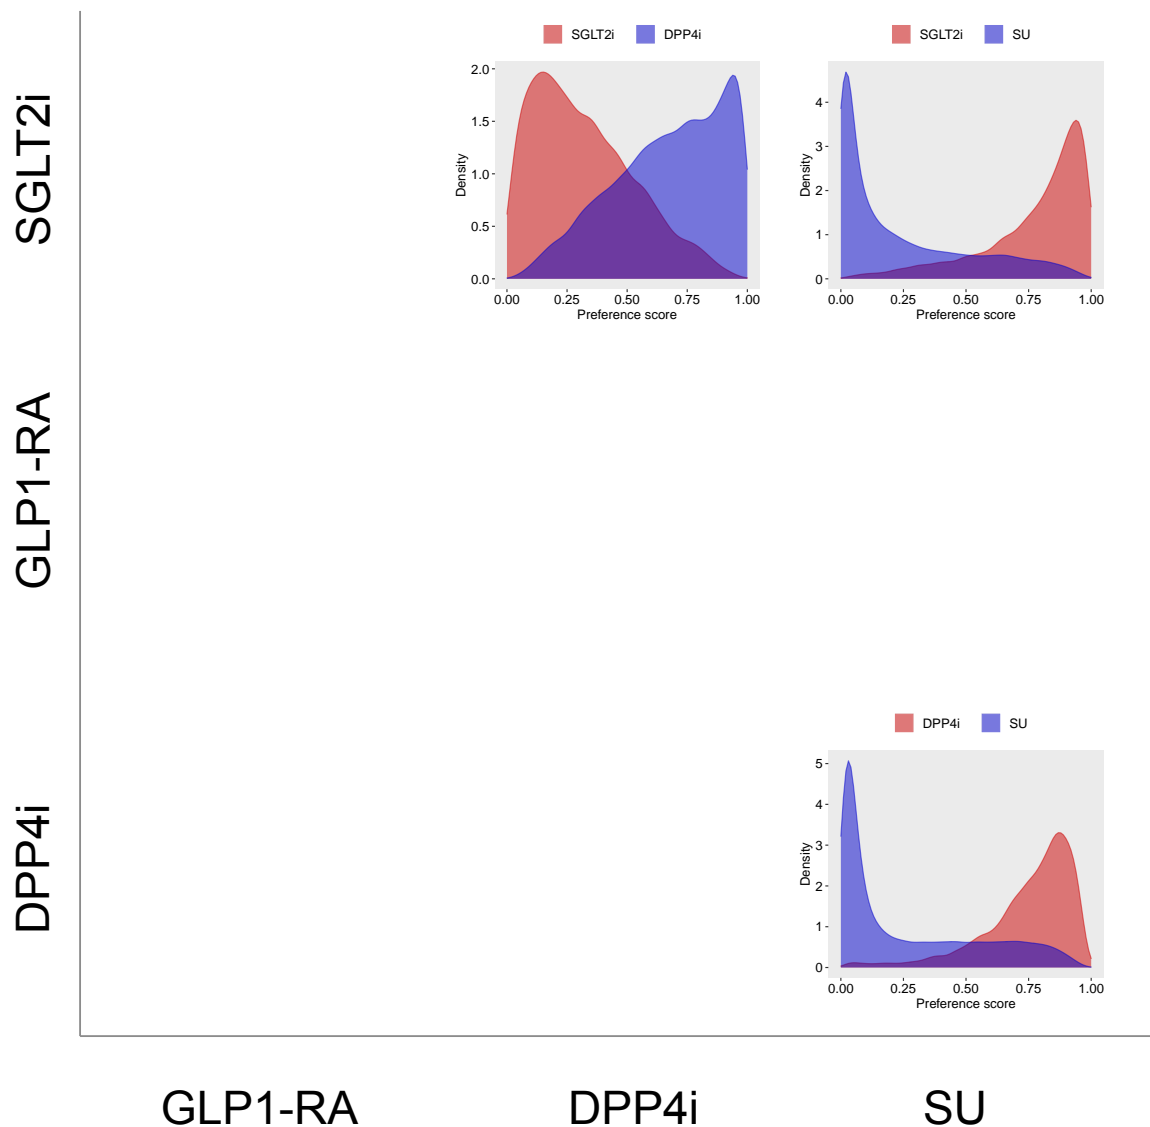

Supplementary Figure 7: Preference score distributions comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in US Open Claims. The preference score is a transformation of the propensity score that adjusts for prevalence differences between populations. For each class pair, we fit a large-scale propensity score model using >40,000 baseline patient characteristics. A higher overlap between score distributions indicates that patients in the target (left, red) and comparator (bottom, blue) populations are more similar in terms of their predicted probability of receiving one treatment over the other. We define clinical empirical equipoise when a majority of patients in both populations carry preference scores between 0.3 and 0.7.

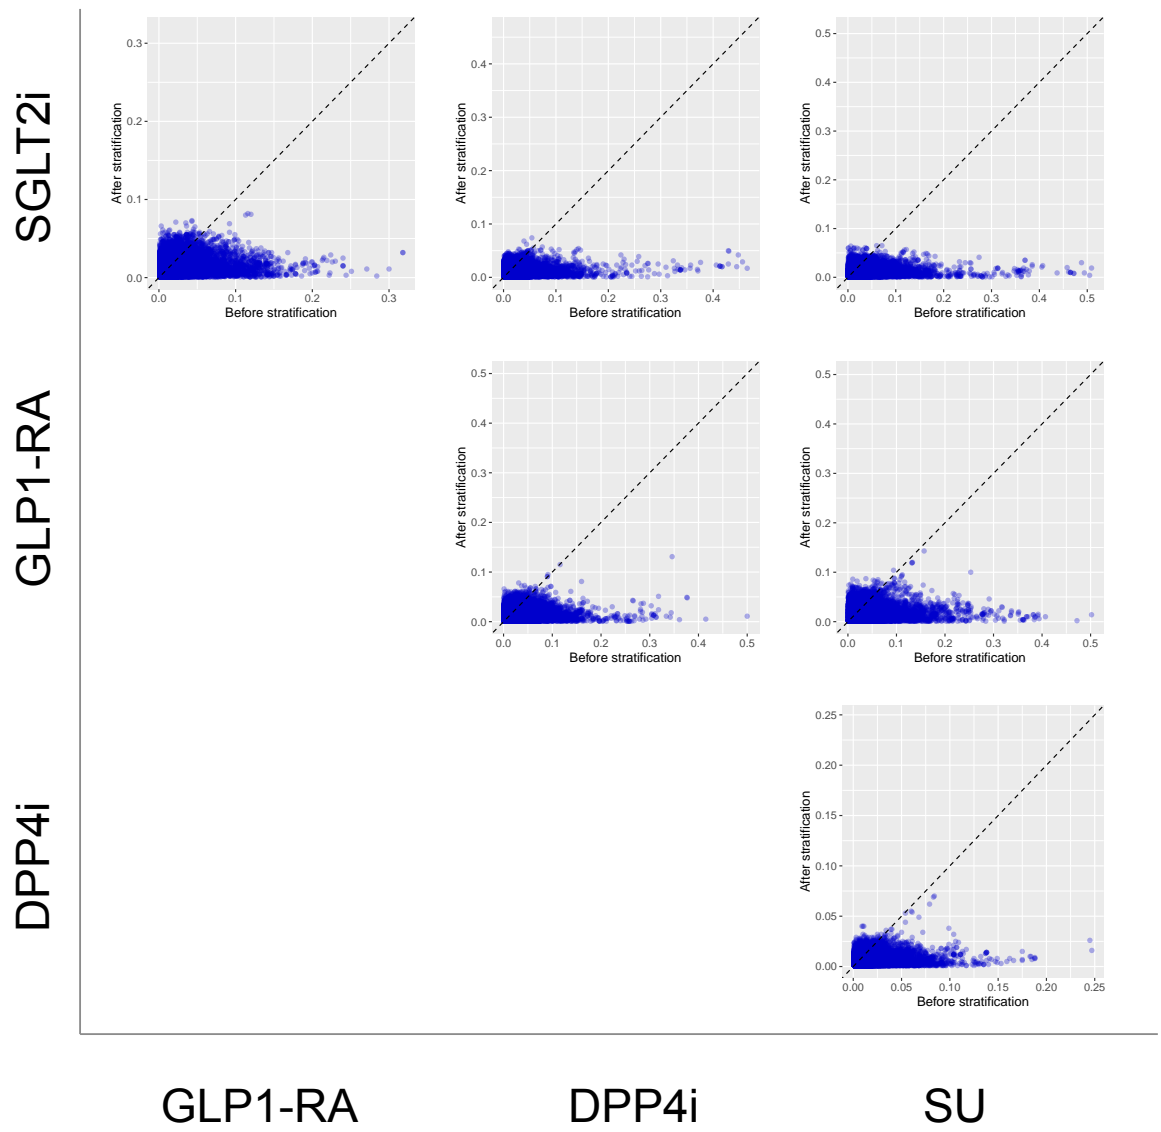

Supplementary Figure 8: Preference score distributions comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in OptumEHR. The preference score is a transformation of the propensity score that adjusts for prevalence differences between populations. For each class pair, we fit a large-scale propensity score model using >40,000 baseline patient characteristics. A higher overlap between score distributions indicates that patients in the target (left, red) and comparator (bottom, blue) populations are more similar in terms of their predicted probability of receiving one treatment over the other. We define clinical empirical equipoise when a majority of patients in both populations carry preference scores between 0.3 and 0.7.

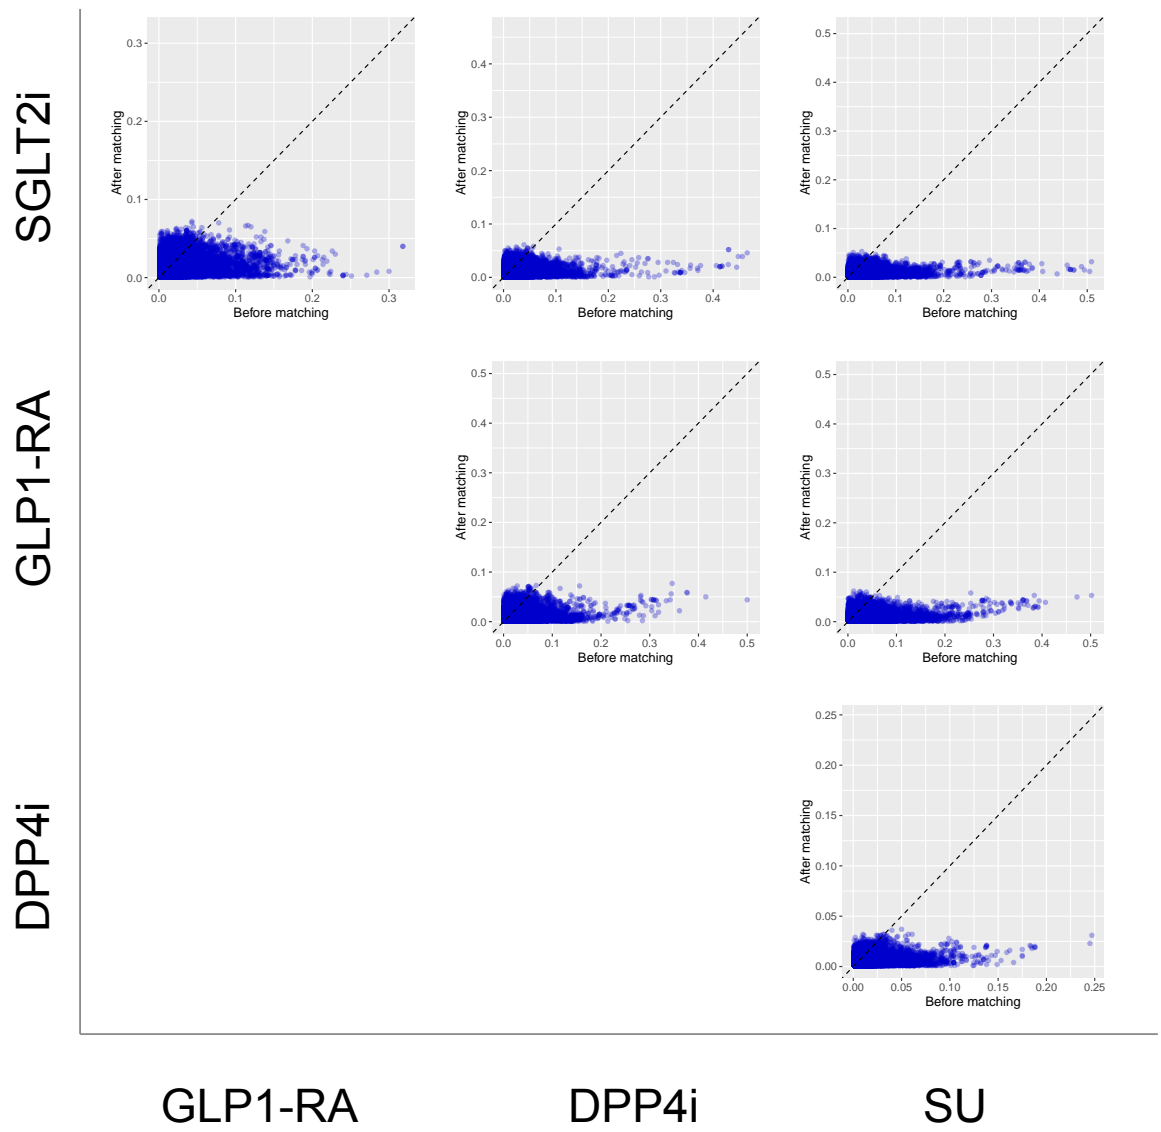

Supplementary Figure 9: Preference score distributions comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in SIDIAP. The preference score is a transformation of the propensity score that adjusts for prevalence differences between populations. For each class pair, we fit a large-scale propensity score model using >40,000 baseline patient characteristics. A higher overlap between score distributions indicates that patients in the target (left, red) and comparator (bottom, blue) populations are more similar in terms of their predicted probability of receiving one treatment over the other. We define clinical empirical equipoise when a majority of patients in both populations carry preference scores between 0.3 and 0.7.

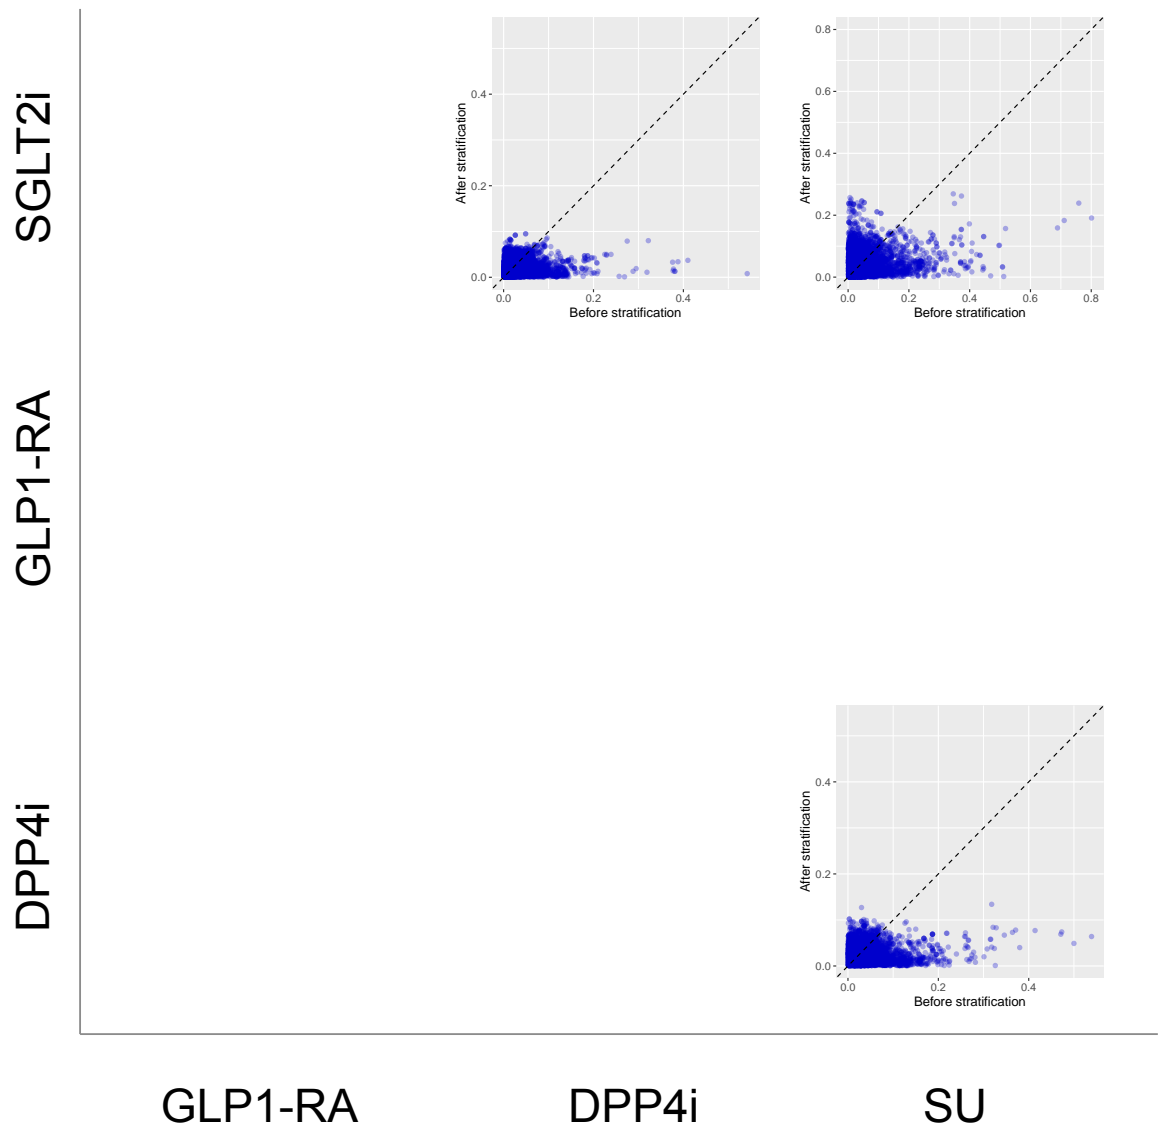

Supplementary Figure 10: Preference score distributions comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in VA. The preference score is a transformation of the propensity score that adjusts for prevalence differences between populations. For each class pair, we fit a large-scale propensity score model using >40,000 baseline patient characteristics. A higher overlap between score distributions indicates that patients in the target (left, red) and comparator (bottom, blue) populations are more similar in terms of their predicted probability of receiving one treatment over the other. We define clinical empirical equipoise when a majority of patients in both populations carry preference scores between 0.3 and 0.7.

Supplementary Figure 11: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in CCAE before/after PS stratification. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS stratification.

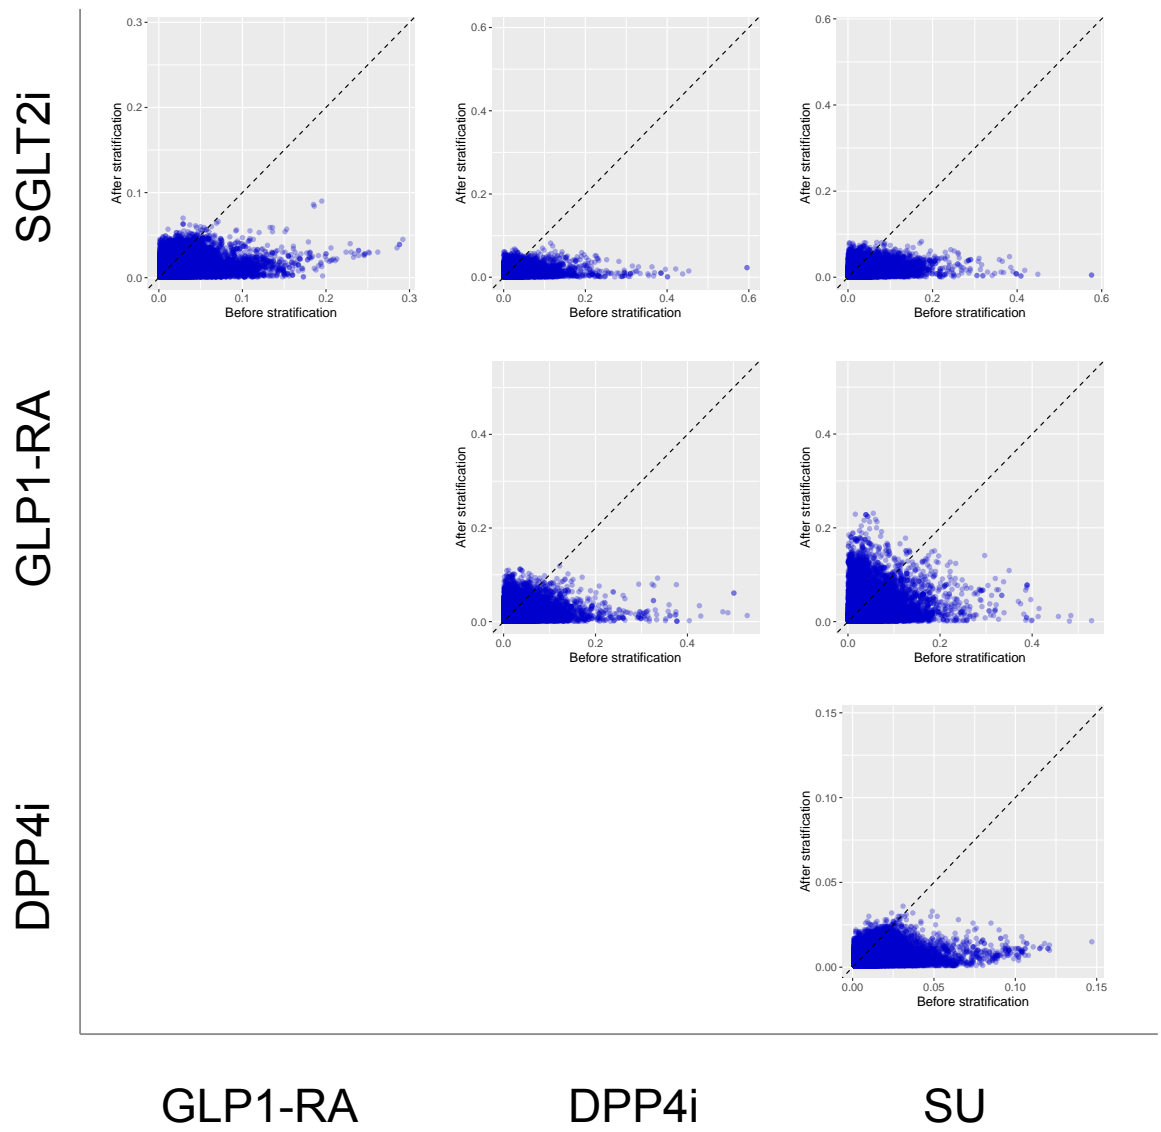

Supplementary Figure 12: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in CCAE before/after PS matching. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS matching.

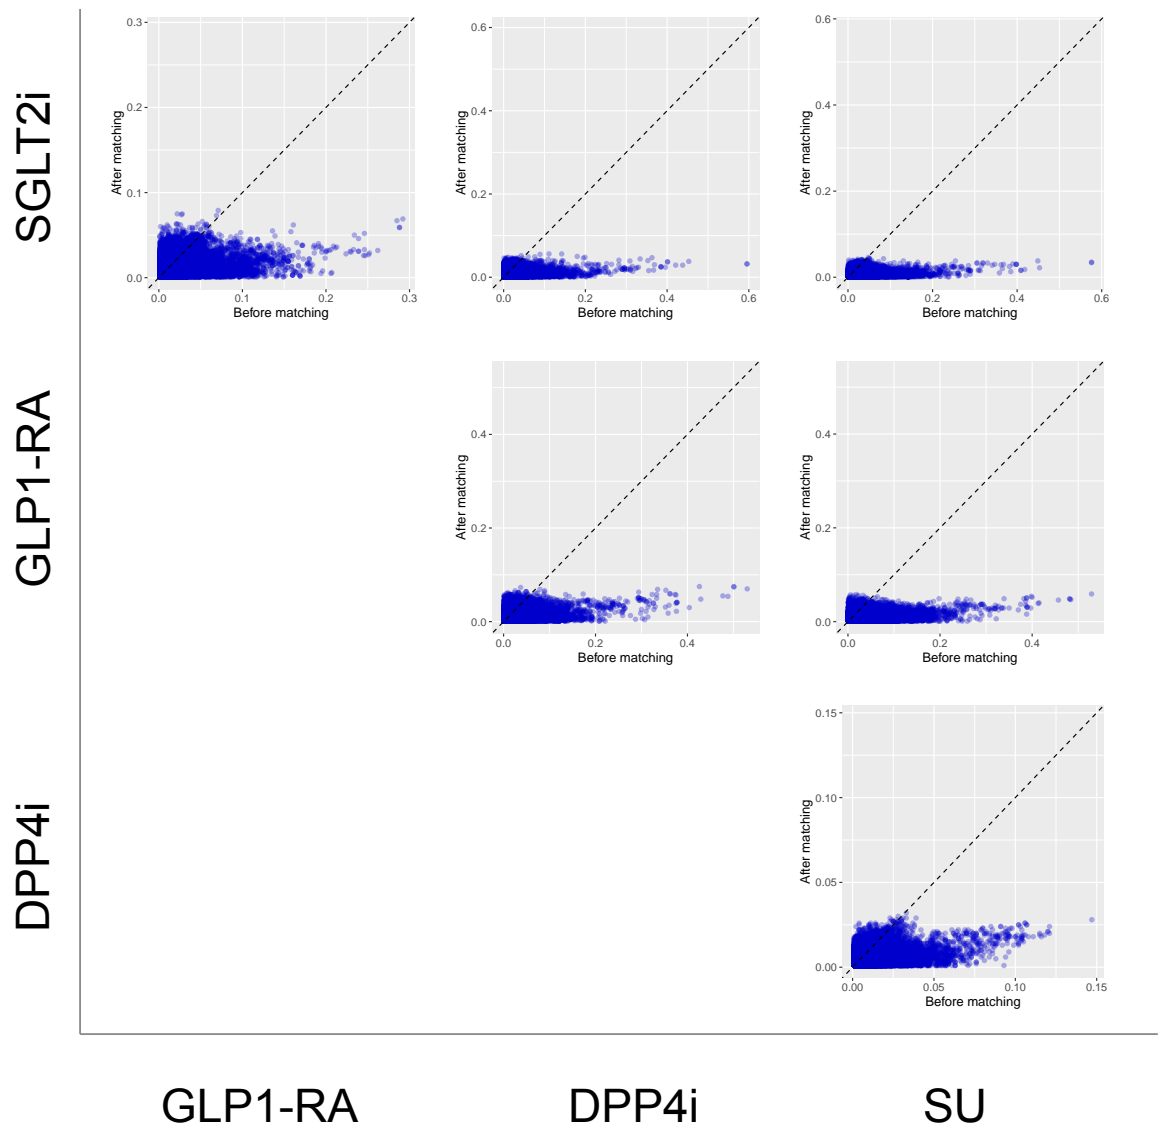

Supplementary Figure 13: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in GDA before/after PS stratification. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS stratification.

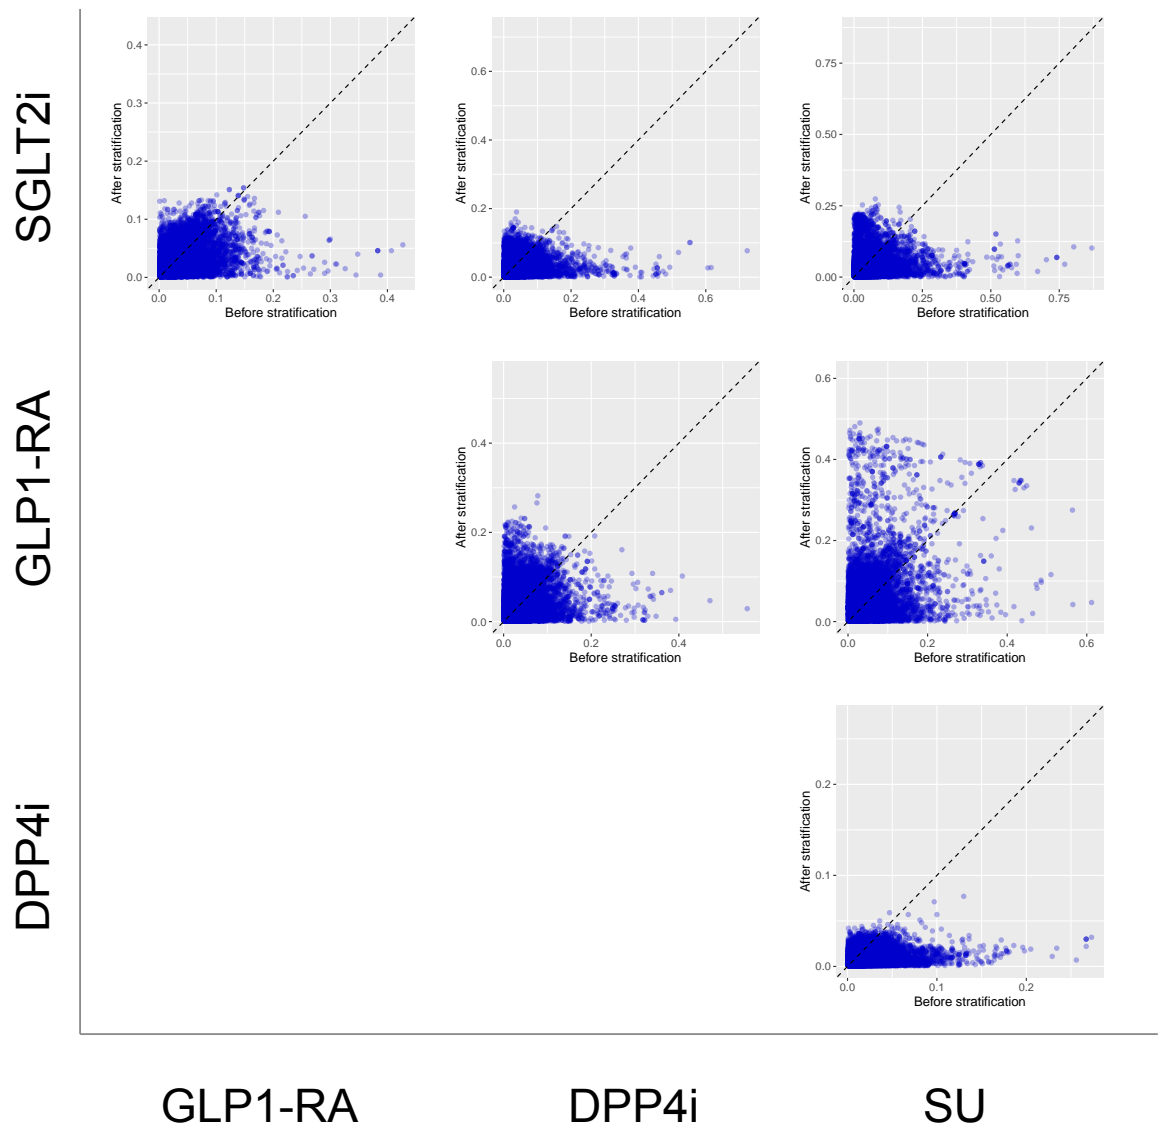

Supplementary Figure 14: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in GDA before/after PS matching. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS matching.

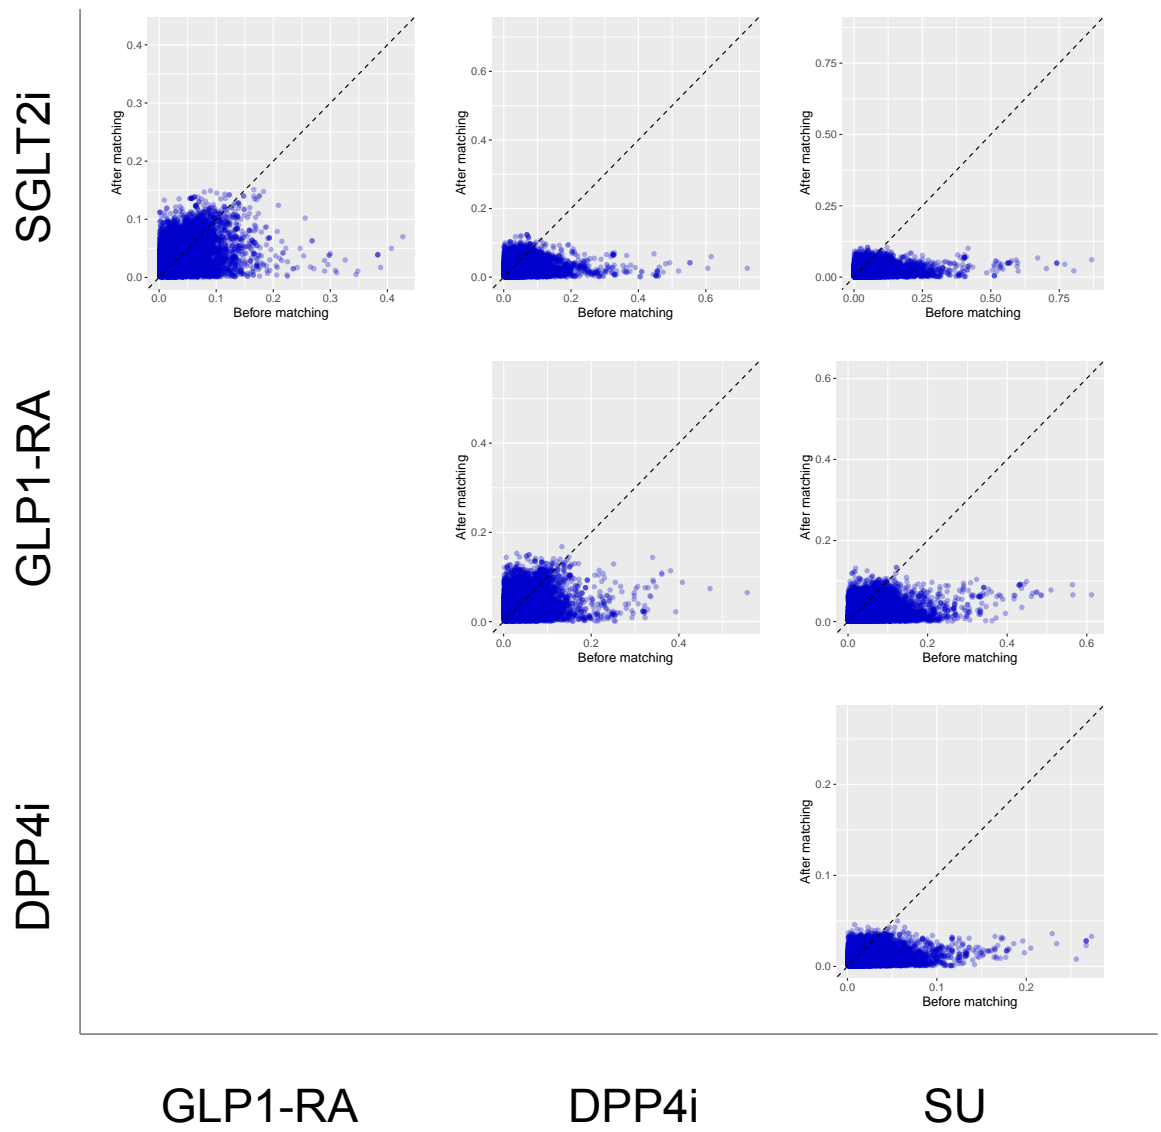

Supplementary Figure 15: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in OptumDOD before/after PS stratification. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS stratification.

Supplementary Figure 16: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in OptumDOD before/after PS matching. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS matching.

Supplementary Figure 17: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in MDCR before/after PS stratification. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS stratification.

Supplementary Figure 18: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in MDCR before/after PS matching. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS matching.

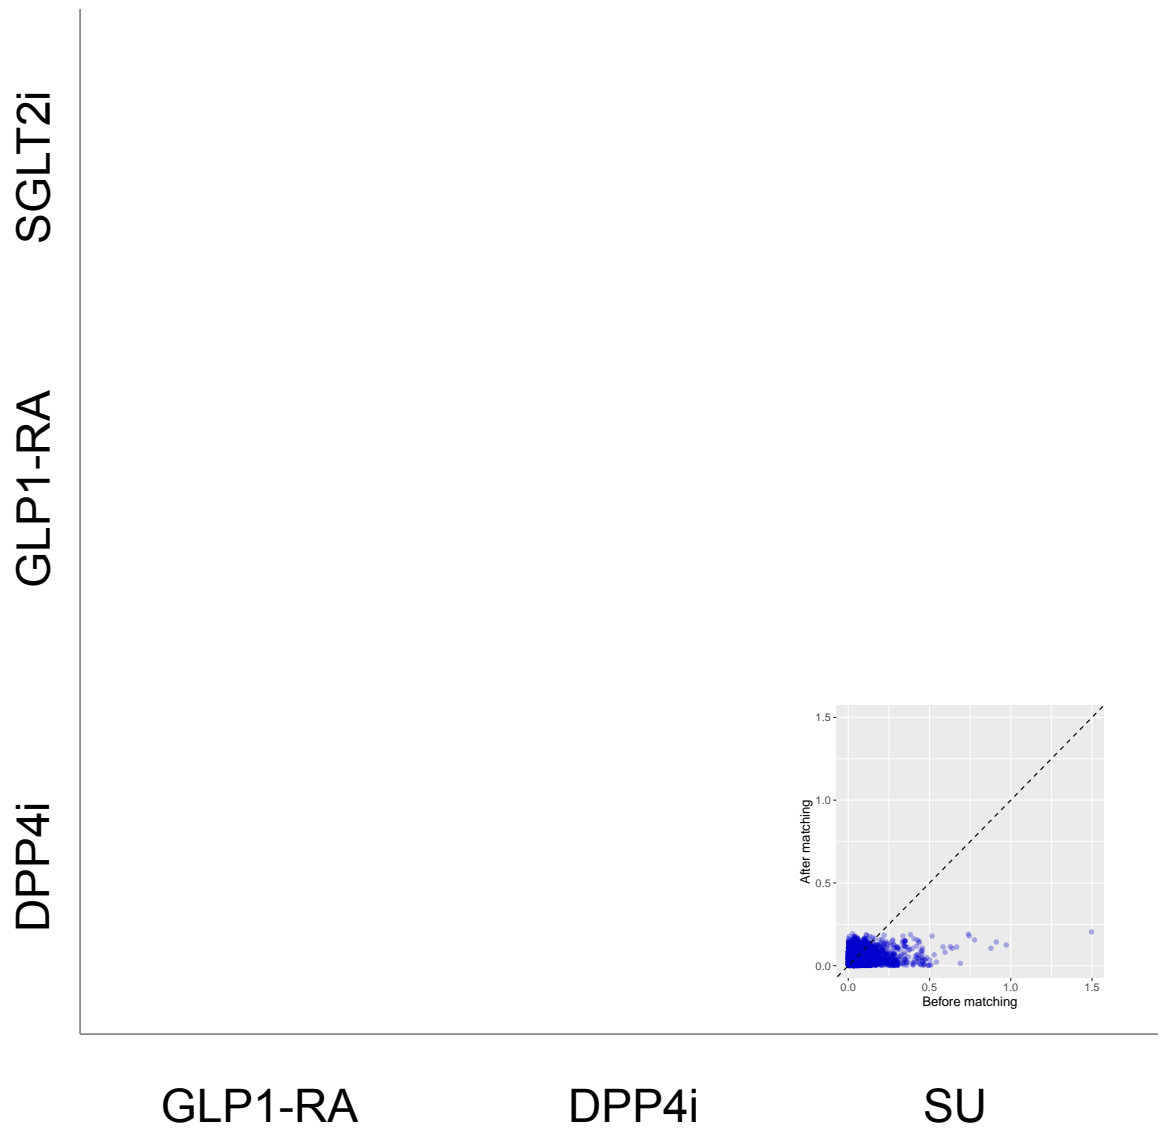

Supplementary Figure 19: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in MDCD before/after PS stratification. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS stratification.

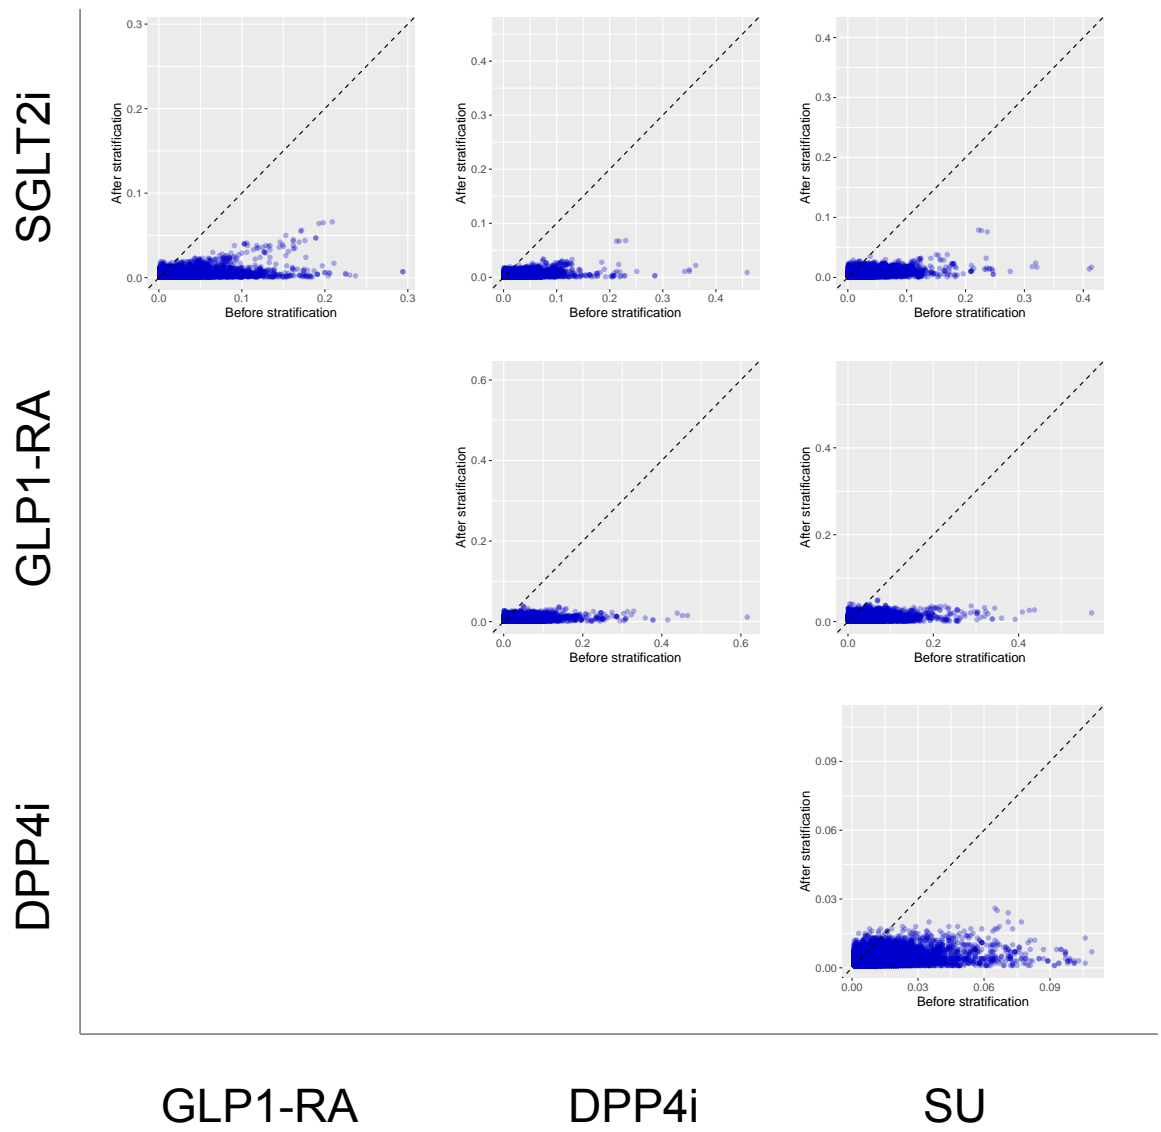

Supplementary Figure 20: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in MDCD before/after PS matching. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS matching.

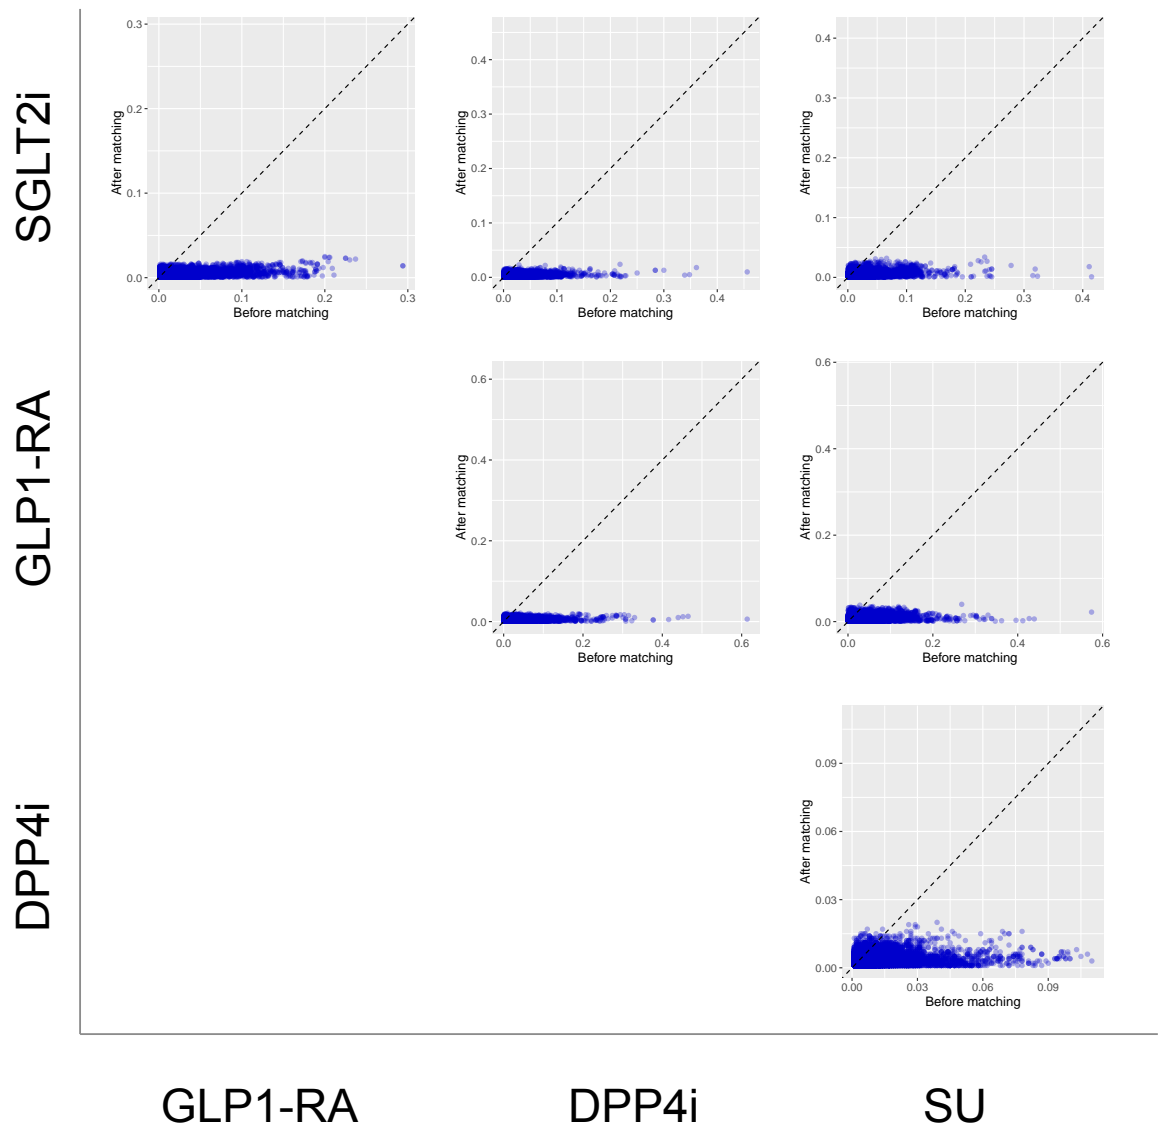

Supplementary Figure 21: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in IMRD before/after PS stratification. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS stratification.

Supplementary Figure 22: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in IMRD before/after PS matching. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS matching.

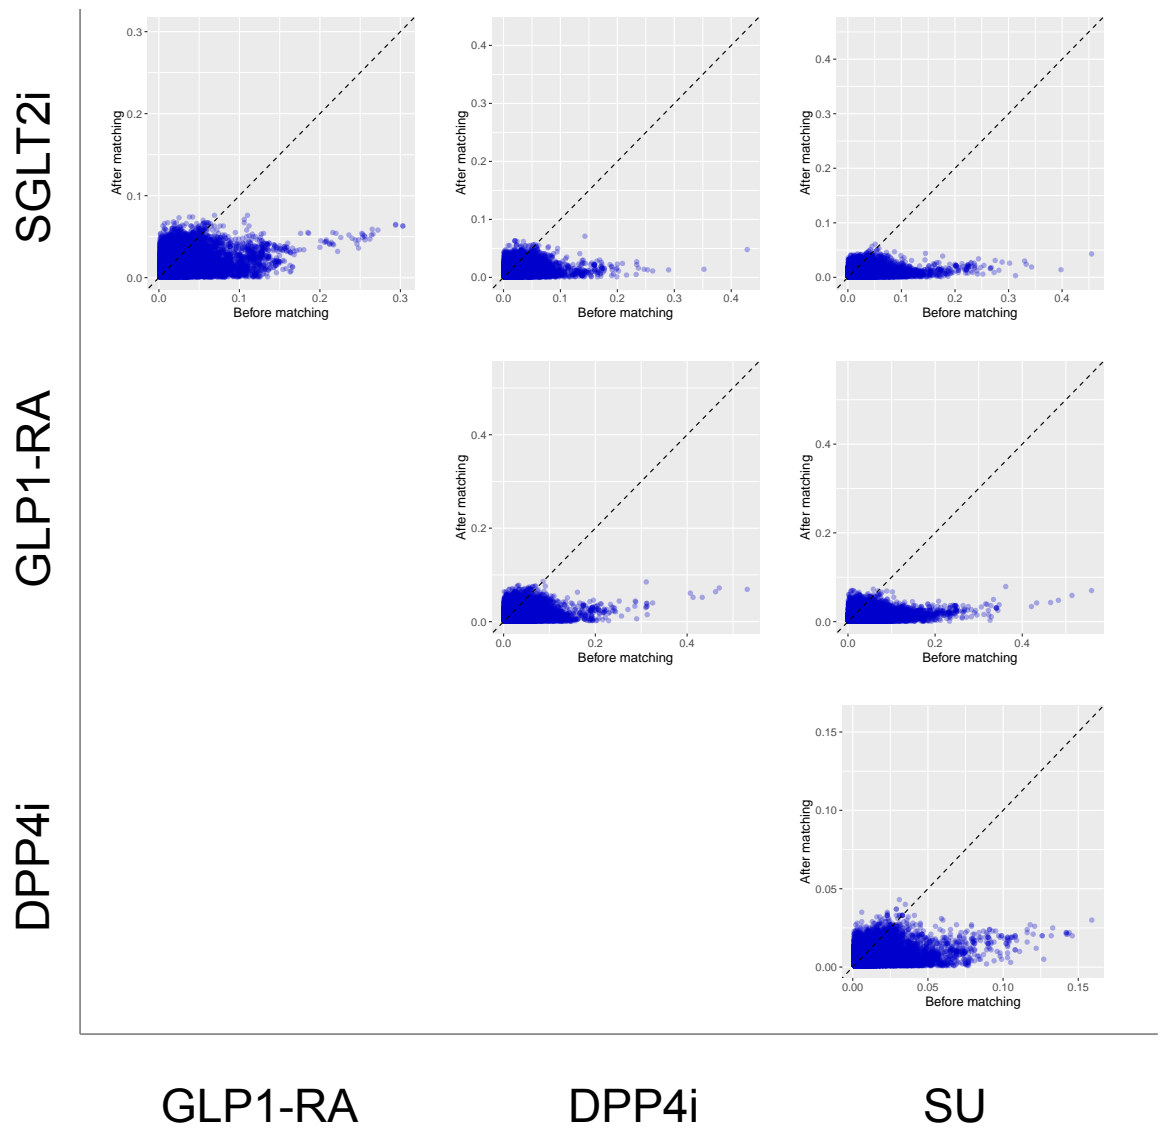

Supplementary Figure 23: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in US Open Claims before/after PS stratification. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS stratification.

Supplementary Figure 24: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in US Open Claims before/after PS matching. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS matching.

Supplementary Figure 25: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in OptumEHR before/after PS stratification. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS stratification.

Supplementary Figure 26: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in OptumEHR before/after PS matching. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS matching.

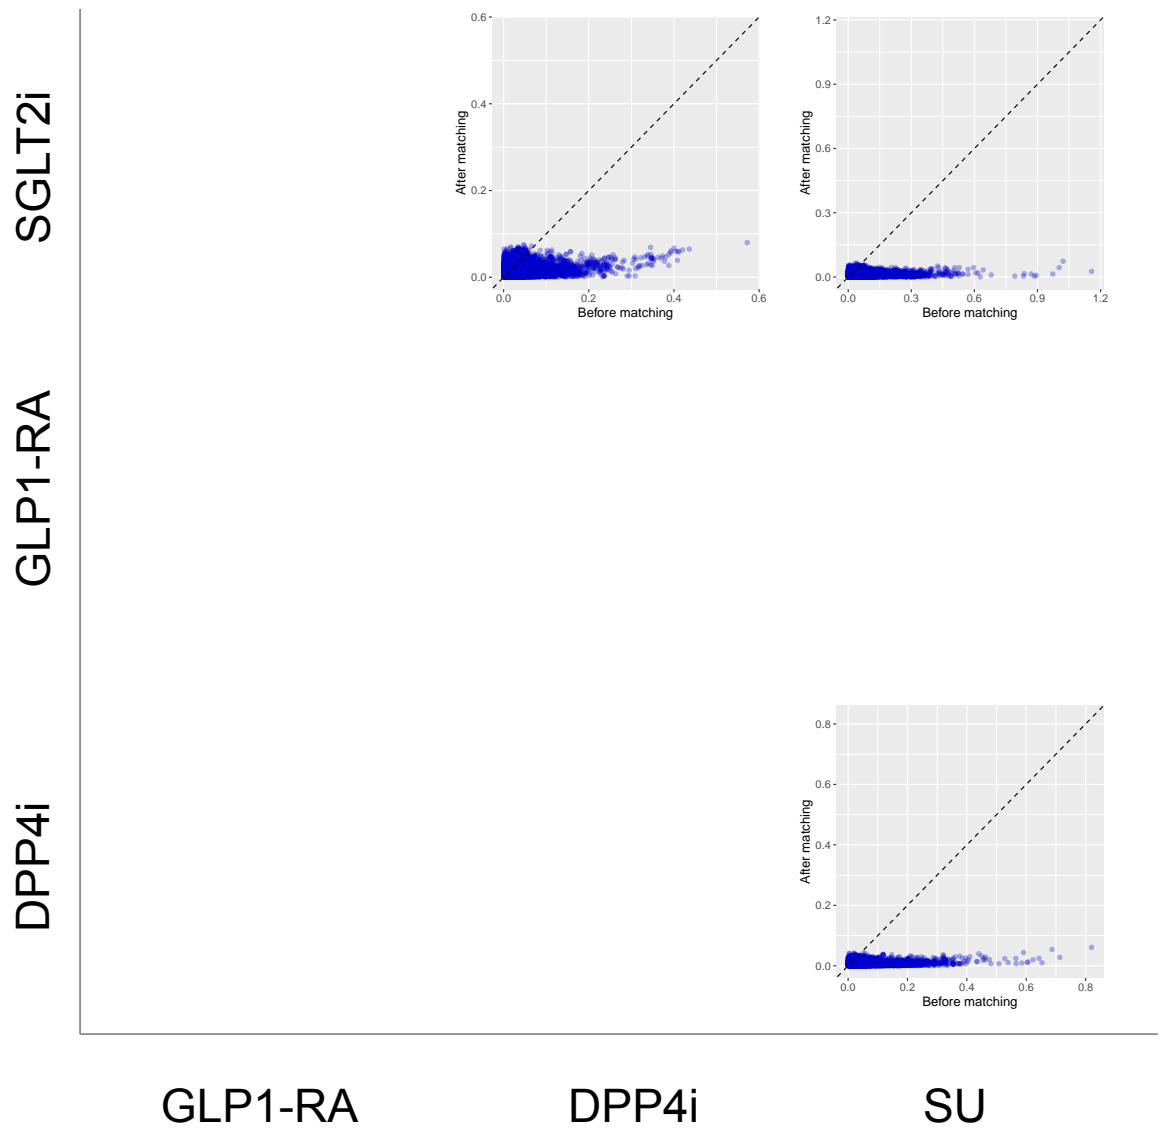

Supplementary Figure 27: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in SIDIAP before/after PS stratification. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS stratification.

Supplementary Figure 28: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in SIDIAP before/after PS matching. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS matching.

Supplementary Figure 29: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in VA before/after PS stratification. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS stratification.

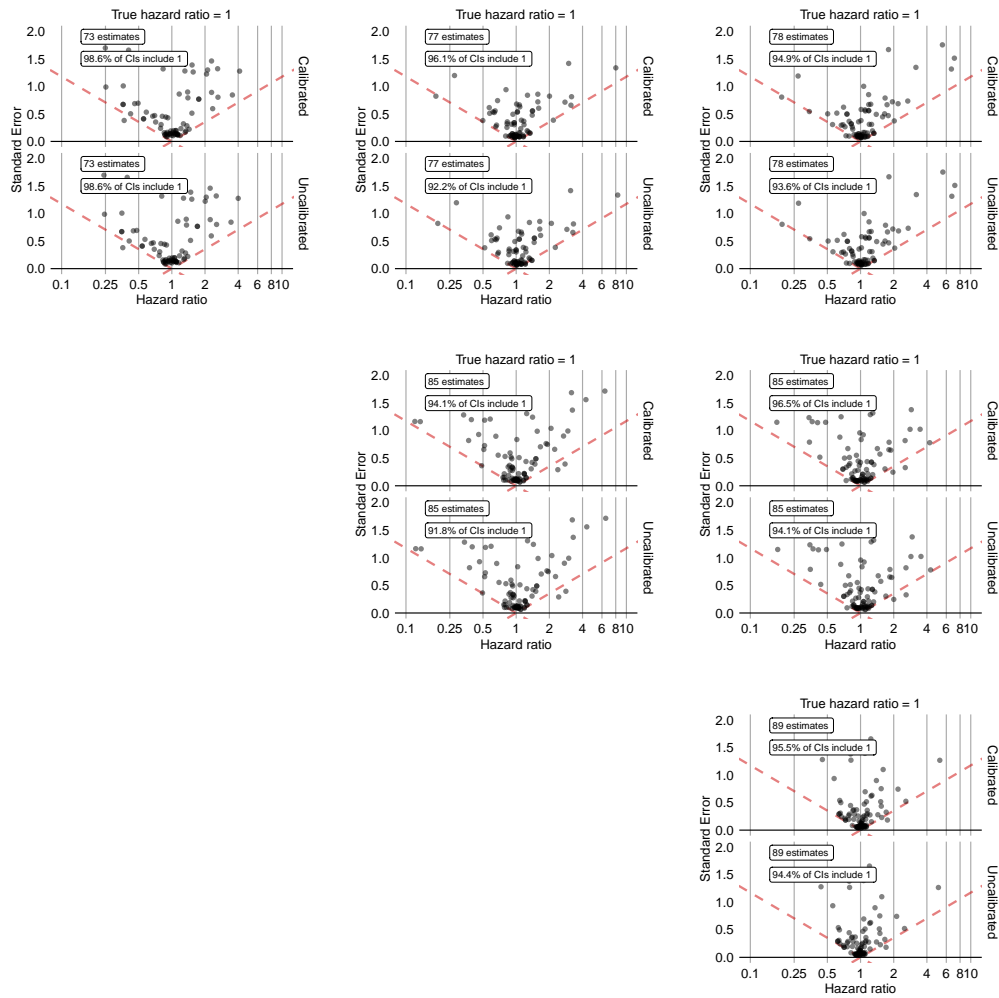

Supplementary Figure 30: Covariate balance comparing SGLT2is, GLP1-RAs, DPP4is, and SUs new-users with established CVD in VA before/after PS matching. Covariate balance is measured by standardized mean differences (SMDs) between covariates in target and comparator cohorts. We show SMDs on >40,000 baseline patient characteristics before and after PS matching.
