FIGI-Net	$58.43{\pm}282.14$	$29.36{\pm}21.21$	
CDC	$157.58 {\pm} 1090.97$	76.49 ± 66.24	

Table S4: Comparison of training duration identification for the proposed model across 1-week and 2-week forecasting horizons

Training Length	1 week		2 week	
framing Length	RMSE	R^2	RMSE	R^2
30 days	$24.45{\pm}14.31$	0.864	29.79 ± 11.45	0.861
45 days	26.28 ± 14.49	0.944	26.42 ± 13.33	0.912
60 days	$19.04{\pm}13.28$	0.968	$24.97{\pm}14.59$	0.933
75 days (Optimal)	14.39 ± 11.23	0.977	$22.71{\pm}12.46$	0.937
90 days	$12.74 {\pm} 9.66$	0.978	20.26 ± 12.66	0.943

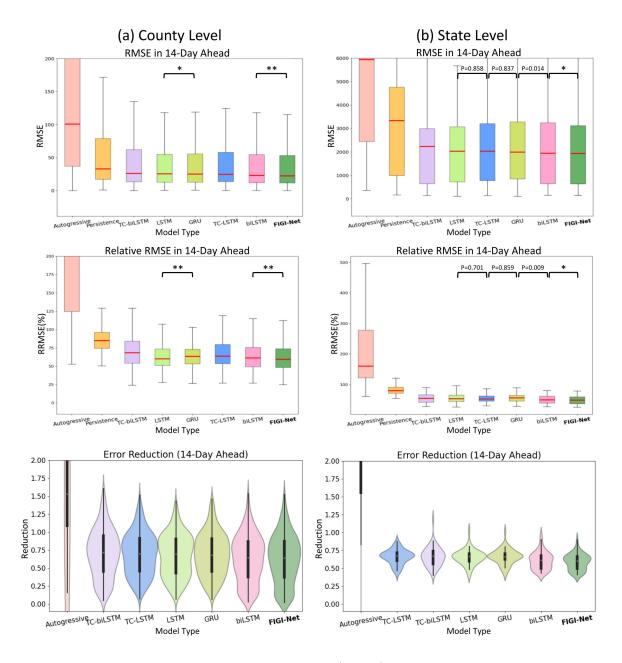

Figure S1: Comparison of Root Mean Squared Error (RMSE), relative RMSE, and error reduction across various models is conducted for a 14-day forecast horizon, analyzed at both (a) county and (b) state levels. The performance assessment reveals that the deep learning-based model exhibits comparable forecasting capability within the 14-day horizon. Furthermore, the FIGI-Net model demonstrates a significant reduction in forecasting errors, approximately 35% at the county level and 50% at the state level, when compared to the persistence model.

: p-value < 0.005

*: p-value<0.001

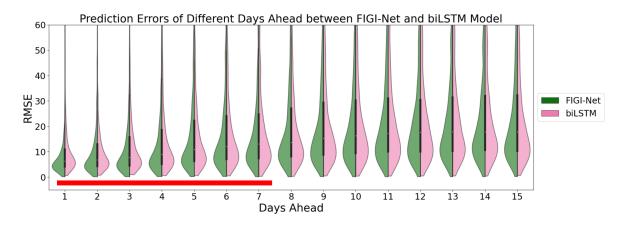

Figure S2: Comparison of RMSE between FIGI-Net and biLSTM across various forecast horizons. Our results indicate that our model yields lower prediction errors for infection numbers within the first 7 days of prediction compared to biLSTM (as indicated by the red line).

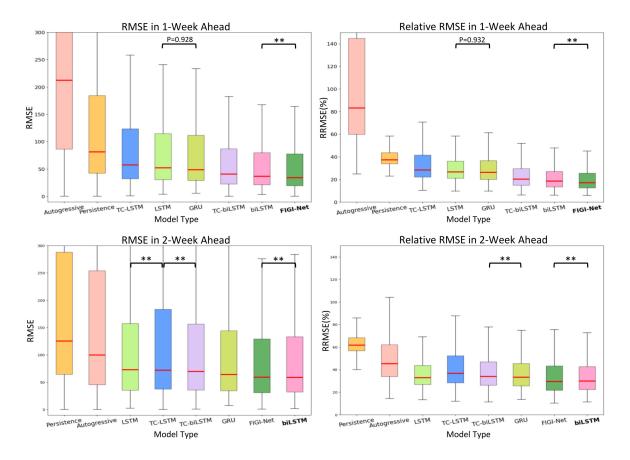

Figure S3: Comparison of various models at the county level across 1 and 2 week ahead horizons. The models are sorted in descending order based on their RMSE values. Notably, our FIGI-Net model demonstrates accurate prediction performance and places among the top 2 with lowest RMSE. *: p-value<0.001

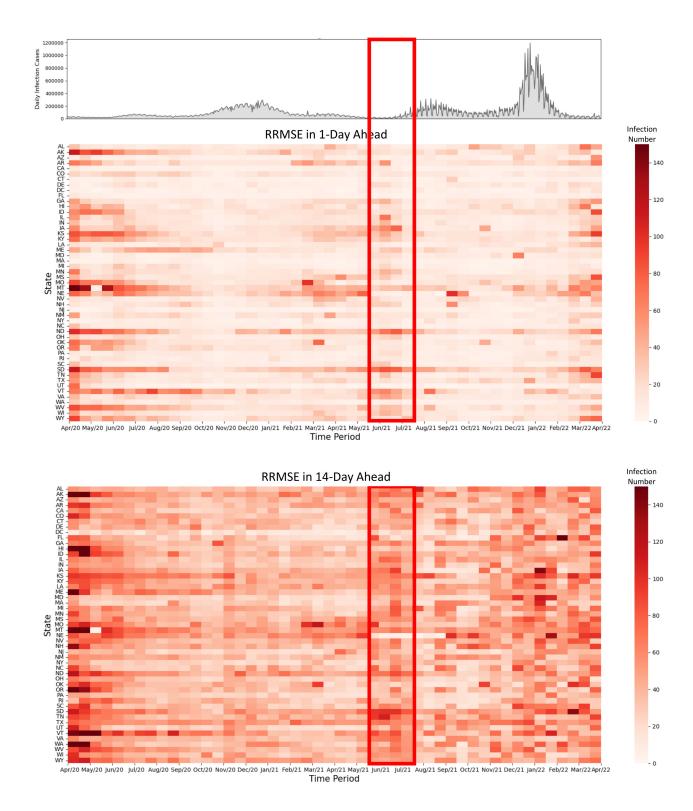

Figure S4: Evolution of prediction error for FIGI-Net at state level. Each column represents the average relative RMSE (each average is computed using a non-overlapping 15-day period between April 2020 and April 2022) across US states for the 1-day and 14-day horizons, compared to the national reported infection trend. We can clearly observe that Missouri, Montana, and Nebraska have large RRMSE values during March 2021 to May 2021 in 1-day ahead prediction. In addition, we can observe that the RRMSE errors increase before the early stage of the next outbreaks (red rectangle).

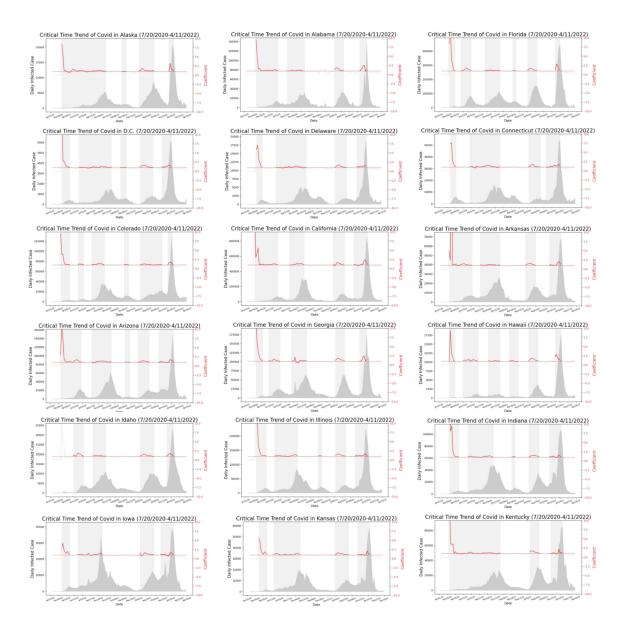

Figure S5: COVID-19 Critical Time Periods for each state in US (Part I). The critical time periods were created by independently quantifying the trend of COVID-19 confirmed cases across each state, and identifying the time periods when the value of the trend exceeded the threshold of 1.0 (marked with a red-dash line in every figure).

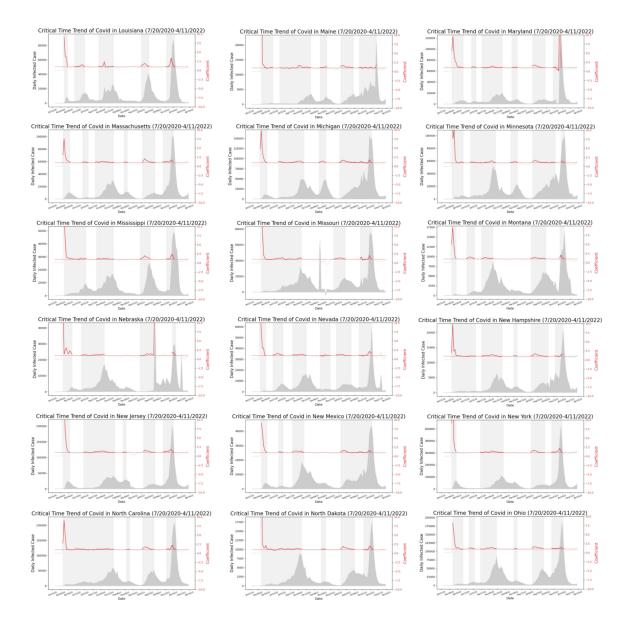

Figure S6: COVID-19 Critical Time Periods for each state in US (Part II).

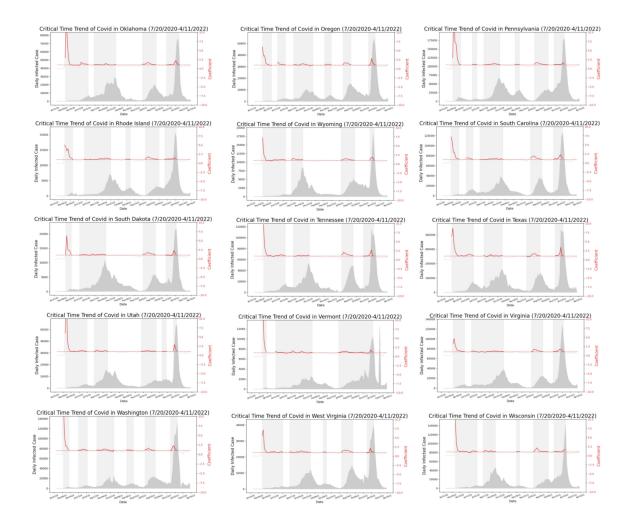

Figure S7: COVID-19 Critical Time Periods for each state in US (Part III).
