

# Supplementary Note 1: Other Performance Metrics

We also show the performance of Delphi for continuous phenotypes in terms of mean absolute error. Delphi also consistently outperforms other methods w.r.t this metric.

**Figure 1.** Mean absolute error of polygenic predictions for five phenotypes in the UK Biobank. Top: All participants; bottom: Individuals from non-British white ancestry. We report results for a linear PRS model, lasso regression, an XGBoost model including the dosage of multiple high-impact SNPs as input, and our method. See Figure 2 for acronyms.
