

## Supplementary Materials

### Head-to-head comparison of leading blood tests for Alzheimer's disease pathology

#### Table of Contents

Table S1. Characteristics of cognitively impaired sub-cohort.....	4
Table S2. Characteristics of cognitively unimpaired sub-cohort. ....	5
Table S3. Characteristics of tau PET sub-cohort. ....	6
Table S4. Characteristics of structural brain MRI sub-cohort.....	7
Table S5. Characteristics of CSF sub-cohort.....	8
Table S6. Classification accuracies of individual and combined plasma biomarker analytes for amyloid PET status defined by Centiloid>20 or ≤20 in the CSF sub-cohort.....	9
Table S7. Classification accuracies of individual plasma biomarker analytes for amyloid PET status defined by Centiloid>20 or ≤20 in the CSF sub-cohort .....	10
Table S8. Classification accuracies of individual and combined plasma biomarker analytes for amyloid PET status defined by Centiloid>20 or ≤20 in the cognitively impaired sub-cohort.....	11
Table S9. Classification accuracies of individual plasma biomarker analytes for amyloid PET status defined by Centiloid>20 or ≤20 in the cognitively impaired sub-cohort .....	12
Table S10. Classification accuracies of individual and combined plasma biomarker analytes for amyloid PET status defined by Centiloid>20 or ≤20 in the cognitively unimpaired sub-cohort....	13
Table S11. Classification accuracies of individual plasma biomarker analytes for amyloid PET status defined by Centiloid>20 or ≤20 in the cognitively unimpaired sub-cohort .....	14
Table S12. Classification accuracies of individual and combined plasma biomarker analytes for amyloid PET status defined by Centiloid >37 or ≤37 in the full cohort .....	15
Table S13. Classification accuracies of individual plasma biomarker analytes for amyloid PET status defined by Centiloid>37 or ≤37 in the full cohort .....	16
Table S14. Classification accuracies of individual and combined plasma biomarker analytes for amyloid PET status defined by Centiloid>37 or ≤37 in the cognitively impaired sub-cohort.....	17
Table S15. Classification accuracies of individual plasma biomarker analytes for amyloid PET status defined by Centiloid>37 or ≤37 in the cognitively impaired sub-cohort .....	18
Table S16. Classification accuracies of individual and combined plasma biomarker analytes for amyloid PET status defined by Centiloid>37 or ≤37 in the cognitively unimpaired sub-cohort....	19
Table S17. Classification accuracies of individual plasma biomarker analytes for amyloid PET status defined by Centiloid>37 or ≤37 in the cognitively unimpaired sub-cohort .....	20
Table S18. Accuracy of published and/or recommended cut-offs for amyloid PET status defined by Centiloid>20 or ≤20 in the full cohort.....	21
Table S19. Correlations between individual plasma biomarker analytes and amyloid PET Centiloid in the cognitively impaired sub-cohort .....	22
Table S20. Correlations between individual plasma biomarker analytes and amyloid PET Centiloid in the cognitively unimpaired sub-cohort .....	23
Table S21. Correlations between individual plasma biomarker analytes and amyloid PET Centiloid in the sub-cohort with amyloid PET >20 Centiloids.....	24
Table S22. Correlations between individual plasma biomarker analytes and amyloid PET Centiloid in the sub-cohort with amyloid PET ≤20 Centiloids.....	25
Table S23. Classification accuracies of individual and combined plasma biomarker analytes for early tau PET status in the full cohort.....	26
Table S24. Classification accuracies of individual plasma biomarker analytes for early tau PET status in the full cohort.....	27

Table S25. Classification accuracies of individual and combined plasma biomarker analytes for early tau PET status in the cognitively impaired sub-cohort .....	28
Table S26. Classification accuracies of individual plasma biomarker analytes for early tau PET status in the cognitively impaired sub-cohort .....	29
Table S27. Classification accuracies of individual and combined plasma biomarker analytes for early tau PET status in the cognitively unimpaired sub-cohort .....	30
Table S28. Classification accuracies of individual and combined plasma biomarker analytes for early tau PET status in the sub-cohort with amyloid PET >20 Centiloids .....	31
Table S29. Classification accuracies of individual plasma biomarker analytes for early tau PET status in the sub-cohort with amyloid PET >20 Centiloids .....	32
Table S30. Classification accuracies of individual and combined plasma biomarker analytes for late tau PET status in the full cohort.....	33
Table S31. Classification accuracies of individual and combined plasma biomarker analytes for late tau PET status in the cognitively impaired sub-cohort .....	34
Table S32. Classification accuracies of individual and combined plasma biomarker analytes for late tau PET status in the cognitively unimpaired sub-cohort.....	35
Table S33. Classification accuracies of individual and combined plasma biomarker analytes for late tau PET status in the sub-cohort with amyloid PET >20 Centiloids. ....	36
Table S34. Correlations between individual plasma biomarker analytes and early tau PET in the full cohort .....	37
Table S35. Correlations between individual plasma biomarker analytes and early tau PET in the cognitively impaired sub-cohort.....	38
Table S36. Correlations between individual plasma biomarker analytes and early tau PET in the cognitively unimpaired sub-cohort.....	39
Table S37. Correlations between individual plasma biomarker analytes and early tau PET in the sub-cohort with amyloid PET >20 Centiloids .....	40
Table S38. Correlations between individual plasma biomarker analytes and late tau PET in the full cohort.....	41
Table S39. Correlations between individual plasma biomarker analytes and late tau PET in the cognitively impaired sub-cohort .....	42
Table S40. Correlations between individual plasma biomarker analytes and late tau PET in the sub-cohort with amyloid PET >20 Centiloids .....	43
Table S41. Classification accuracies of individual and combined plasma biomarker analytes for cortical thickness status in the full cohort. ....	44
Table S42. Classification accuracies of individual plasma biomarker analytes for cortical thickness status in the full cohort .....	45
Table S43. Classification accuracies of individual and combined plasma biomarker analytes for cortical thickness status in the cognitively impaired sub-cohort .....	46
Table S44. Classification accuracies of individual plasma biomarker analytes for cortical thickness status in the cognitively impaired sub-cohort .....	47
Table S45. Classification accuracies of individual and combined plasma biomarker analytes for cortical thickness status in the sub-cohort with amyloid PET >20 Centiloids .....	48
Table S46. Classification accuracies of individual plasma biomarker analytes for cortical thickness status in the sub-cohort with amyloid PET >20 Centiloids .....	49
Table S47. Correlations between individual plasma biomarker analytes and cortical thickness in the full cohort .....	50
Table S48. Correlations between individual plasma biomarker analytes and cortical thickness in the cognitively impaired sub-cohort.....	51
Table S49. Correlations between individual plasma biomarker analytes and cortical thickness in the sub-cohort with amyloid PET >20 Centiloid .....	52

Table S50. Classification accuracies of individual and combined plasma biomarker analytes for cognitive status in the full cohort .....	53
Table S51. Classification accuracies of individual plasma biomarker analytes for cognitive status in the full cohort.....	54
Table S52. Classification accuracies of individual and combined plasma biomarker analytes for cognitive status in the sub-cohort with amyloid PET >20 Centiloids.....	55
Table S53. Classification accuracies of individual plasma biomarker analytes for cognitive status in the sub-cohort with amyloid PET >20 Centiloids .....	56
Table S54. Correlations between individual plasma biomarker analytes and dementia symptoms.....	57
Table S55. Correlations between individual plasma biomarker analytes and dementia symptoms in the sub-cohort with amyloid PET >20 Centiloids .....	58
Appendix A. Derivation of cut-offs for tau PET and cortical thickness abnormality.....	59
Appendix B. Datasets and code used for analyses .....	61
Table B1. Demographic, cognitive, CSF, and imaging measures .....	61
Table B2. Plasma biomarkers.....	62
Code B1. R script for combining plasma into a single dataset.....	63
Code B2. R script for merging plasma dataset with other variables .....	66
Code B3. R script for creating cross-sectional dataset used in analysis .....	71
Code B4. Function bank used in non-AUC/ROC analysis .....	74
Code B5. R code for creating characteristics tables (uses function bank) .....	91
Code B6. R code for creating Spearman heatmaps (uses function bank) .....	95
Code B7. R code for Spearman analysis (uses function bank) .....	99
Code B8. R code for scatter plots (uses function bank).....	121
Code B9. R code for creating ROC plots (requires B10) .....	124
Code B10. R code for creating models used in plotting ROC curves .....	126
Code B11. R code for obtaining AUC values for covariate-only models .....	132
Code B12. R code for creating AUC tables .....	134
Code B13. R code for creating AUC forest plots (requires B14) .....	146
Code B14. R code for functions used in making AUC forest plots .....	148
Appendix C. External quality control analyses.....	156

**Table S1. Characteristics of cognitively impaired sub-cohort.** Continuous values are presented as the median with the interquartile range. The significance of differences by amyloid PET status were evaluated with Wilcoxon's rank-sum tests for continuous variables and Chi square or Fisher's exact tests for categorical variables. All tests were two sided and not adjusted for covariates or multiple comparisons. Please see the methods and **Appendix A** for definitions of early tau PET, late tau PET, and cortical thickness.

**Table S5. Characteristics of CSF sub-cohort.** Continuous values are presented as the median with the interquartile range. The significance of differences by amyloid PET status were evaluated with Wilcoxon's rank-sum tests for continuous variables and Chi square or Fisher's exact tests for categorical variables. All tests were two sided and not adjusted for covariates or multiple comparisons. Please see the methods and **Appendix A** for definitions of early tau PET, late tau PET, and cortical thickness.

**Table S6. Classification accuracies of individual and combined plasma biomarker analytes for amyloid PET status defined by Centiloid>20 or ≤20 in the CSF sub-cohort.** The receiver operating characteristics area under the curve (AUC) point estimate (midpoint) and 95% confidence intervals are shown for classification of amyloid PET status (> or ≤20 Centiloids) by individual or combined plasma biomarker analytes. Both the unadjusted AUC and the AUC adjusted for age, sex, and *APOE* genotype are provided. AUCs were compared using DeLong's test. The Benjamin-Hochberg procedure was used to adjust for multiple comparisons with the reference analyte, either within a company or across companies. The AUC for a model with covariates only was 0.798 (0.716-0.879).

**Table S15. Classification accuracies of individual plasma biomarker analytes for amyloid PET status defined by Centiloid>37 or ≤37 in the cognitively impaired sub-cohort.** The receiver operating characteristics area under the curve (AUC) point estimate (midpoint) and 95% confidence intervals are shown for classification of amyloid PET status (> or ≤37 Centiloids) by plasma biomarker analytes. The single cut-off for the plasma biomarker that best distinguished amyloid PET status based on the Youden index is shown, as well as the positive percent agreement (PPA), negative percent agreement (NPA), overall accuracy, positive predictive value (PPV), and negative predictive value (NPV) of the cut-off for amyloid PET status in the cognitively impaired sub-cohort, which had a 52.1% rate of amyloid PET positivity based on a cut-off of >37 Centiloids.

**Table S16. Classification accuracies of individual and combined plasma biomarker analytes for amyloid PET status defined by Centiloid>37 or ≤37 in the cognitively unimpaired sub-cohort.** The receiver operating characteristics area under the curve (AUC) point estimate (midpoint) and 95% confidence intervals are shown for classification of amyloid PET status (> or ≤37 Centiloids) by individual or combined plasma biomarker analytes. Both the unadjusted AUC and the AUC adjusted for age, sex, and *APOE* genotype are provided. AUCs were compared using DeLong's test. The Benjamin-Hochberg procedure was used to adjust for multiple comparisons with the reference analyte, either within a company or across companies. The AUC for a model with covariates only was 0.713 (0.639-0.788).

**Table S24. Classification accuracies of individual plasma biomarker analytes for early tau PET status in the full cohort.**

The receiver operating characteristics area under the curve (AUC) point estimate (midpoint) and 95% confidence intervals are shown for classification of early tau PET status by plasma biomarker analytes. The single cut-off for the plasma biomarker that best distinguished early tau PET status based on the Youden index is shown, as well as the positive percent agreement (PPA), negative percent agreement (NPA), overall accuracy, positive predictive value (PPV), and negative predictive value (NPV) of the cut-off for early PET status in the full cohort, which had a 21.3% rate of early tau PET positivity.

**Table S26. Classification accuracies of individual plasma biomarker analytes for early tau PET status in the cognitively impaired sub-cohort.** The receiver operating characteristics area under the curve (AUC) point estimate (midpoint) and 95% confidence intervals are shown for classification of early tau PET status by plasma biomarker analytes. The single cut-off for the plasma biomarker that best distinguished early tau PET status based on the Youden index is shown, as well as the positive percent agreement (PPA), negative percent agreement (NPA), overall accuracy, positive predictive value (PPV), and negative predictive value (NPV) of the cut-off for early tau PET status in the cognitively impaired sub-cohort, which had a 48.7% rate of early tau PET positivity.

**Table S31. Classification accuracies of individual and combined plasma biomarker analytes for late tau PET status in the cognitively impaired sub-cohort.** The receiver operating characteristics area under the curve (AUC) point estimate (midpoint) and 95% confidence intervals are shown for classification of late tau PET status by individual or combined plasma biomarker analytes. Both the unadjusted AUC and the AUC adjusted for age, sex, and *APOE* genotype are provided. AUCs were compared using DeLong's test. The Benjamin-Hochberg procedure was used to adjust for multiple comparisons with the reference analyte, either within a company or across companies. The AUC for a model with covariates only 0.661 (0.520-0.803).

**Table S41. Classification accuracies of individual and combined plasma biomarker analytes for cortical thickness status in the full cohort.** The receiver operating characteristics area under the curve (AUC) point estimate (midpoint) and 95% confidence intervals are shown for classification of cortical thickness status by individual or combined plasma biomarker analytes. Both the unadjusted AUC and the AUC adjusted for age, sex, and *APOE* genotype are provided. AUCs were compared using DeLong's test. The Benjamin-Hochberg procedure was used to adjust for multiple comparisons with the reference analyte, either within a company or across companies. The AUC for a model with covariates only was 0.758 (0.664-0.852).

**Table S53. Classification accuracies of individual plasma biomarker analytes for cognitive status in the sub-cohort with amyloid PET >20 Centiloids.** The receiver operating characteristics area under the curve (AUC) point estimate (midpoint) and 95% confidence intervals are shown for classification of cognitive status by plasma biomarker analytes. The single cut-off for the plasma biomarker that best distinguished cognitive status based on the Youden index is shown, as well as the positive percent agreement (PPA), negative percent agreement (NPA), overall accuracy, positive predictive value (PPV), and negative predictive value (NPV) of the cut-off for cognitive impairment status in the sub-cohort with amyloid PET >20 Centiloids, which had a 60.2% rate of cognitive impairment.

## Appendix A. Derivation of cut-offs for tau PET and cortical thickness abnormality.

Utilizing the entire ADNI dataset, without limiting data to the plasma study subset, a mixture model was applied using the expectation-maximization algorithm within the R statistical environment. This model was independently fitted to three distinct Analytes: the mesial temporal meta-ROI flortaucipir SUVR (Figure A1), the temporal-parietal meta-ROI flortaucipir SUVR (Figure A2), and the meta-ROI cortical thickness measure (Figure A3). The following approach was applied to derive the cut-off thresholds: for both the mesial temporal meta-ROI flortaucipir SUVR and the temporal-parietal meta-ROI flortaucipir SUVR, thresholds were established at a value equal to the mean plus two standard deviations of the first component, which corresponds to the normal distribution within the mixture model. Conversely, the cut-off threshold for the meta-ROI cortical thickness was positioned at the mean minus two standard deviations of the second component, again aligning with the normal distribution curve represented within the model. The estimated cut-off thresholds derived from these calculations are reported in Table A1.

**Table A1. Cut-off thresholds for ADNI dataset, including mesial temporal and temporal-parietal meta-ROI flortaucipir SUVRs, and meta-ROI cortical thickness.** Thresholds are derived from mixture model analysis, indicating mean plus or minus two standard deviations for the corresponding normal distribution components.

Outcome Analyte	Cut-off
mesial temporal meta-ROI flortaucipir SUVR	1.328 SUVR
temporal-parietal meta-ROI flortaucipir SUVR	1.224 SUVR
cortical thickness within the meta-ROI	2.572 mm

**Figure A1: Distribution of mesial temporal meta-ROI flortaucipir SUVR values across the ADNI dataset, with the mixture model fit displayed.**

**Figure A2: Distribution of temporal-parietal meta-ROI flortaucipir SUVR values, with the mixture model overlay.**

**Figure A3: Distribution of meta-ROI cortical thickness measurements with mixture model fit.**

#### Pulling all functions together to construct tables

#dataset - input data - needs to contain all variables in binvar and varlist
#binvar and binvarlab - the binary variable which will determine the columns after the "all"
#columns and the label will determine
#how the columns are named. both of these need to be strings
#varlist - list of variables, simple as it sounds, it needs to be a vector of strings
#typelist - here's where things get a little complicated. this needs to be the exact same length as
#the varlist, as it's what
#determines how each entry is handled
#Here are the type listings
#A - this is the code for any analyte/non-normal variable. It will output an entry with the median
#and interquartile range
#T - this code is very similar to the previous one, it's only use specifically for Tracers when
#dealing with different measurement standards for
#SUVR, the namelist entry, where the labels are, will be used to determine which tracer this entry
#will represent

```

```

#P - this is the code that is used to create entries based on binary variables. Specifically the
#"positive" status that is measured
#is whatever R would place in the second slot of the variable when placed into the table function
#This is usually used for things like disease or biomarker status, but can be used for other things
as well
#namelist - list of labels that go along with varlist and typelist, needs to be in order
corresponding to those two
#filout - output destination for resulting excel table
