Population Genetic Analysis

In order to better understand the population frequencies of p.Arg1231Cys variant and its implications for stroke risk across South Asia (SAS) and neighboring West Asia / North Africa (also referred to as the Greater Middle East, abbreviated GME), a regional survey of p.Arg1231Cys was conducted. For these analyses, public datasets such as 1000 Genomes Phase 3 [1], GnomAD [2], Greater Middle East (GME) Variome [3], Iranome [4], and QChip Knowledgebase [5] were used. p.Arg1231Cys was enriched (AAF > 0.001) in most GME and SAS populations sampled.

- QChip Knowledgebase, Qatar (AAF = 0.0075)
- GME Variome (AAF = 0.004)
 - Allele Counts (RR:RA:AA)
 - Northwest Africa (98:01:00), AAF = 0.0051
 - Northeast Africa (367:01:00); AAF = 0.0014
 - Arabian Peninsula (168:03:00); AAF = 0.0088
 - Israel (10:00:00); AAF = 0.0
 - Syrian Desert (58:00:00); AAF = 0.0
 - Turkish Peninsula (163:01:00); AAF = 0.003
 - Central Asia (130:02:00); AAF = 0.0076
- Iranome
 - Lur (AAF = 0.01)
 - Baloch (AAF = 0.005)
 - Kurd (AAF = 0.005)
 - Persian (AF = 0.005)
 - Turkmen (AF = 0.005)
- GnomAD, Pooled SAS (AAF=0.00536)
- 1000 Genomes Phase 3
 - Aggregate SAS (AAF=0.0041)
 - GIH, Gujarati Indians in Houston, USA (AAF = 0.0049)
 - ITU, Indian Telugu in the UK (AAF=0.0049)
 - PJJ, Punjabi in Lahore, Pakistan (AAF= 0.0052)
 - STU, Sri Lankan Tamil in the UK (AAF= 0.0049)
 - BEB, Bengali in Bangladesh (not detected)
- UKB Participants born in SAS or GME (n > 100)
 - SAS (aggregate AAF = 0.0042),
 - Afghanistan (AAF = 0.005)
 - Pakistan (AAF = 0.003)
 - India (AAF = 0.0041)
 - GME (aggregate AAF = 0.0031)
 - Egypt (not detected)
 - Turkey (AAF = 0.0029)
 - Iran (AAF = 0.0049)

Variant Prevalence in Pakistani Population Clusters

Combined analysis of 37 K exomes from the PGR, 1000G and UKB identified three major clusters of Pakistanis, and ethnic/caste data was used to label them as Punjab/Rajput which clustered with 1000G Punjab; Ansari, which formed a distinct cluster closer to populations from Eastern India; and Baloch/Pathan which clustered with Afghans (**Supplementary Figure 5, Supplementary Table 9**). The variant was enriched (AAF > 0.005) in all three clusters.

- Baloch/Pathan (AAF = 0.0074)
- Punjab/Rajput (AAF = 0.006)
- Ansari (AAF = 0.0056)

Supplementary Tables

Supplementary Table 1. ExWAS in PGR Discovery Cohort across 5 Stroke Phenotypes¹.

| # | Phenotype | N Cases ¹ | N Controls | Total |
|---|--|----------------------|------------|--------|
| 1 | Stroke | 5,135 | 26,602 | 31,737 |
| 2 | Ischemic | 2,619 | 26,602 | 29,221 |
| 3 | Intracerebral hemorrhage | 1,533 | 26,602 | 28,135 |
| 4 | Subcortical intracerebral hemorrhage | 1,388 | 26,602 | 27,990 |
| 5 | Partial anterior circulation infarcts (PACI) | 1,274 | 26,602 | 27,876 |

- ¹. Shown are 5 stroke phenotypes that were ascertained for cases using TOAST [6] and Oxfordshire [7] criteria. From left-to-right is the phenotype name, detailed description, number of cases, number of controls, and total sample size among the PGR discovery cohort participants.
- ². While other ischemic stroke subtypes were identified using TOAST and Oxfordshire criteria, this study was limited to subtypes with at least 500 cases. Other ischemic stroke subtypes (including posterior circulation infarction, total anterior circulation infarct, lacunar infarct, cardioembolism, large artery atherosclerosis, and small artery atherosclerosis) had fewer than 500 cases. Using the University of Michigan Genetic Association Study Power Calculator [8], we estimated power over a range of alternate allele frequency (AAF) and genotype relative risk (GRR) values. Looking across a range of AAF's, we estimate that a variant would need to have 0.11 AAF to achieve 80% power with 500 cases and 26,602 controls, significance level of 5.0×10^{-8} , disease prevalence of 0.0011 and a genotype relative risk of 2.0. Looking across a range of GRRs, we estimate that a variant with a AAF of 0.01 would need to have a GRR of 6.0 to achieve 80% power with 500 cases and 26,602 controls, significance level of 5.0×10^{-8} , disease prevalence of 0.0011. With less than 500 cases, power to detect association at the genome-wide level of significance (5.0×10^{-8}) would require a very large effect size (e.g. 6.0).

Supplementary Table 2. Association Summary Statistics for p.Arg1231Cys *NOTCH3* and 5 Stroke Phenotypes in PGR Discovery Cohort¹.

| Phenotype (ordered by increasing odds ratio) | Odds Ratio (95% Confidence Interval) | P value | AAF | Num Cases | Num Controls |
|---|---|----------------|------------|----------------------|-------------------------|
| Ischemic | 1.80 (1.23, 2.64) | 2.49E-03 | 5.64E-03 | 2540 42 2 | 25619 271 2 |
| Partial anterior circulation infarcts (PACI) | 1.99 (1.23, 3.22) | 4.84E-03 | 5.56E-03 | 1227 25 1 | 25619 271 2 |
| Stroke | 2.2 (1.7, 2.9) | 4.93E-08 | 6.10E-03 | 4939 98 3 | 25619 271 2 |
| Intracerebral hemorrhage | 3.17 (2.12, 4.73) | 1.79E-08 | 5.82E-03 | 1451 44 0 | 25619 271 2 |
| Subcortical intracerebral hemorrhage | 3.39 (2.26, 5.1) | 3.87E-09 | 5.84E-03 | 1313 43 0 | 25619 271 2 |

- ¹. Shown are ExWAS summary statistics for 5 stroke phenotypes and the *NOTCH3* p.Arg1231Cys variant. From left-to-right is the phenotype, effect size, effect size 95% confidence interval (lower, upper), p value, alternate allele frequency (AAF), cases count subdivided by genotype (homozygous reference | heterozygous | homozygous alternate) and controls count subdivided by genotype (homozygous reference | heterozygous | homozygous alternate).

Supplementary Table 3. Phenome-wide Association Summary Statistics for p.Arg1231Cys *NOTCH3* and Comorbidities and Related Binary Phenotypes in PGR Discovery Cohort¹.

| Phenotype (Binary Traits) | Odds Ratio | P value | AAF | Cases | Controls |
|--|---------------------------|----------|----------|-------------|-------------|
| | (95% Confidence Interval) | | | | |
| Subcortical intracerebral hemorrhage | 3.4 (2.3, 5.1) | 3.87E-09 | 5.80E-03 | 1313 43 0 | 25619 271 2 |
| Intracerebral hemorrhage diagnosis | 3.2 (2.1, 4.7) | 1.80E-08 | 5.80E-03 | 1451 44 0 | 25619 271 2 |
| Stroke | 2.2 (1.7, 2.9) | 4.93E-08 | 6.10E-03 | 4939 98 3 | 25619 271 2 |
| Partial anterior circulation infarcts (PACI) | 2 (1.2, 3.2) | 4.85E-03 | 5.60E-03 | 1227 25 1 | 25619 271 2 |
| Lacunar cerebral infarct (LACI) | 2.9 (1.3, 6.3) | 7.05E-03 | 5.40E-03 | 364 8 1 | 25619 271 2 |
| Stroke, undetermined cause | 1.9 (1.2, 3) | 7.81E-03 | 5.50E-03 | 1395 26 1 | 25619 271 2 |

¹. Shown are ExWAS summary statistics for stroke comorbidities and the *NOTCH3* p.Arg1231Cys variant in the PGR discovery cohort. From left-to-right is the phenotype name, effect size (regression beta), effect size (95% confidence interval), p value, alternate allele frequency (AAF), and sample size count subdivided by genotype (homozygous reference | heterozygous | homozygous alternate).

Supplementary Table 5. Inclusion of risk factors in regression model¹.

| Phenotype (in order of increasing odds ratio) | Odds Ratio (95% Confidence Interval) | P value | AAF | Num Cases | Num Controls |
|--|---|----------------|------------|----------------------|-------------------------|
| Ischemic | 1.60 (1.08, 2.38) | 2.04E-02 | 5.52E-03 | 2471 37 2 | 24151 256 0 |
| Partial anterior circulation infarcts (PACI) | 1.81 (1.11, 2.97) | 1.80E-02 | 5.48E-03 | 1196 23 1 | 24151 256 0 |
| Stroke | 2.01 (1.49, 2.69) | 3.18E-06 | 6.02E-03 | 4696 90 3 | 24151 256 0 |
| Intracerebral hemorrhage | 2.96 (1.95, 4.5) | 3.64E-07 | 5.76E-03 | 1408 42 0 | 24151 256 0 |
| Subcortical intracerebral hemorrhage | 3.19 (2.08, 4.88) | 9.87E-08 | 5.77E-03 | 1273 41 0 | 24151 256 0 |

- ¹. To assess the impact of other risk factors for stroke, statistical analysis was repeated in PGR discovery cohort cases and controls with smoking and hypertension as covariates in the model. Shown are results for association test between *NOTCH3* p.Arg1231Cys and five stroke phenotypes including standard covariates as well as smoking and hypertension. From left to right is the cohort, model, odds ratio (95% confidence interval), p value, alternate allele frequency, and genotype counts among cases and controls (reference homozygotes | heterozygotes | alternate allele homozygotes).

Supplementary Table 6. Computational Prediction of Variant Deleteriousness¹.

| Algorithm | Score | Interpretation |
|------------------------------|--------------|-----------------------|
| SIFT 4G converted rank score | 0.639 | Deleterious |
| PolyPhen2 Hum Div | 0.843 | Possibly Damaging |
| PolyPhen2 Hum Var | 0.462 | Possibly Damaging |
| Mutation Taster Rank Score | 0.588 | Deleterious |
| CADD | 25.1 | Pathogenic |

¹. To computationally assess pathogenicity for *NOTCH3* p.Arg1231Cys, the variant was submitted to online portals for scoring using 5 algorithms. Details of the variant submitted included the GRCh38 coordinates Chr19:15179052, the reference and alternate allele G>A, and the ENSEMBL transcript ID ENST00000263388. Shown is a summary of the output, including the algorithm, the quantitative score reported and the interpretation of the score.

Supplementary Table 7. *NOTCH3* p.Arg1231Cys Homozygotes in PGR¹.

| Cohort ² | ID ³ | Age (decade) ⁴ | Sex ⁵ | BMI ⁶ | Stroke | Type of Stroke | Migraine | Dementia | Depression | Hypertension | Diabetes | Other | Family History of CVD | Status at follow up |

1. Shown are relevant observations in the medical history of *NOTCH3* p.Arg1231Cys homozygotes identified in exome sequencing of the discovery cohort (top, numbered 1 to 9 by age and gender) or callback within families of exome-sequenced homozygotes (bottom, numbered 1 to 3 by age and gender), including , age, sex, BMI, stroke, type of stroke (if known), migraine with or without aura, dementia, depression, hypertension, diabetes, other family history of cardiovascular diseases, and status at follow up. Proband at the top were identified through exome sequencing of PGR, while homozygotes identified through callback are at the bottom. CVD = cardiovascular disease. HTN = hypertension. MI = myocardial infarction, SVT = supraventricular tachycardia
2. Cohorts include 31 K discovery 30 K replication, 14 K follow-up and n = 128 callback cohorts.
3. Individual #3 in top and bottom table are the same individual, aged in the 40s during recruitment and in the 50s during callback. Both individual IDs marked with an “*”.
4. Age in decades
5. Sex: M=male, F=female
6. Body Mass Index (BMI) measured in kg/m²

Supplementary Table 8. Comparison of NOTCH3 p.Arg1231Cys Genotypes in Callback Participants¹

| Phenotype | Counts (RR RA AA) | Homozygote RR | Heterozygote RA | Homozygote AA |
|-----------------------------------|-------------------------------------|----------------------|----------------------|----------------------|

¹. Shown is a summary by genotype of the 128 callback participants, including 27 families of heterozygotes and 1 homozygotes family successfully contacted for a recall study and genotyped for Arg1231Cys. In total 2 additional homozygotes were identified, 50 heterozygous carriers and 75 non-carriers among the families. Baseline characteristics and self-reported medical history for all individuals is provided in the table. From left-to-right is the phenotype, the total genotype counts (RR =reference homozygote | RA = heterozygote | AA = alternate homozygote), and the median with interquartile range in parenthesis for RR, RA and AA genotypes. Quantitative traits on top and binary traits on the bottom. eGFR: estimated Glomerular Filtration Rate (Calculate from creatinine using MDRD equation, BMR: Base Metabolic Rate, FFM: Fat Free Mass, Hgb: Hemoglobin, Hct: Hematocrit, MCV: Mean Corpuscular Volume, MCH: , Mean Corpuscular Hemoglobin, MCHC: Mean Corpuscular Hemoglobin Concentration, Plt: Platelets, MI: Myocardial Infarction

Supplementary Table 9. Comparison of *NOTCH3* p.Arg1231Cys Genotypes in PGR¹

| Phenotype | Genotype counts (RR RA AA) | Homozygous RR | Heterozygous RA | Homozygous AA | P val additive | P val Het RA vs Hom AA |

¹. Characteristics of non-carriers, heterozygotes and homozygotes of Arg1231Cys across 75,819 sequenced individuals in PGR. P-values were generated using whole genome regression as implemented in REGENIE adjusting for age, age², age*sex, sex and top 10 genetic PCs. Hypertension was self-reported. Type 2 Diabetes cases were defined as individuals self-reporting to have diabetes, or HbA1c > 6.5, or on oral hypoglycemic medication. eGFR was calculated using MDRD equation.

¹. To assess the prevalence of p.Arg1231Cys across ethnic groups, the first seven principal components (PCs) were quantified from Illumina GSA-V2 array data for a sample of PGR where self-reported ethnicity was available, and a UMAP plot [9] was produced from the data. Genetic data for the rest of the PGR cohort was projected into this space. Visual inspection of the plot identified three major ethnic groups, including Ansari (South Asian), Rajput/ Punjabi (South Asian), and Balochi/ Pathan (West Asian). Allele frequency within each ethnic group was calculated from exome sequence data. From left-to-right is the ethnicity, chromosome, variant (chr:pos:ref:alt), alternate allele, reference allele, alternate allele frequency, allele count, alternate allele count, reference allele count.

Supplementary Table 12. Significant and Suggestive ExWAS Hits in PGR Discovery Cohort Across 5 Stroke Phenotypes¹.

| Category ² | Variant | Nearest Gene | DbSNP rsID | Phenotype | Odds ratio (95% CI) | P value | AAF | Cases (RR RA AA) | Controls (RR RA AA) |

- ¹ Shown are the top hits ($p < 1.0 \times 10^{-7}$) for 5 stroke Phenotype ExWAS in the PGR discovery cohort in addition to *NOTCH3* p.Arg1231Cys. From left-to-right is the stage in the analysis (initial or conditional), variant name (Chr:pos:ref:alt), nearest gene, dbSNP rsID, phenotype, effect size, odds ratio (95% confidence interval), p value, cases count (total | homozygous reference | heterozygous | homozygous alternate), controls count (total | homozygous reference | heterozygous | homozygous alternate).
- ² Initial analysis revealed an association between LSP intronic variant rs661348, a locus where two other non-coding variants (rs1973765 and rs569550) were previously associated with stroke in a large multi-ethnic GWAS [10]. A conditional analysis was conducted, conditional on the two known variants.

Supplementary Table 14. PheWAS of Binary Traits in PGR Discovery Cohort for *LSP1* rs661348¹.

| Phenotype | Odds ratio (95% CI) | P value | AAF | Cases (RR RA AA) | Controls (RR RA AA) |
|---|---------------------|----------|------|------------------|---------------------|

Rodriguez-Flores et al.

NOTCH3 p.Arg1231Cys is Markedly Enriched in South Asians and Associated with Stroke

Version 34

17 June 2024

1. ExWAS summary statistics were available for 6,396 binary phenotypes out of 10,168 phenotypes tested for association in UKB 450K Europeans. Shown is the phenotype code, p value, odds ratio with 95% confidence interval, case RR|RA|AA counts, controls RR|RA|AA counts. Shown are phenotypes with p values < 0.05.
2. Highlight of phenotypes mentioned in the results section.

Supplementary Table 20. Quantitative Phenotypes Associated with *NOTCH3* p.Arg1231Cys in UKB 450 K European Participants¹.

| Phenotype | P value | Beta (95% CI) | AAF | Cases (RR RA AA) | Units |
|--|----------|-----------------|---------|------------------|-----------------|
| Mean MD in external capsule on FA skeleton right - imaging visit - value 0 | 5.40E-10 | 1.4 (0.96, 1.8) | 0.00028 | 33550 19 0 | AU |
| Mean MD in superior corona radiata on FA skeleton right - imaging visit - value 0 | 7.60E-10 | 1.4 (0.94, 1.8) | 0.00028 | 33550 19 0 | AU |
| Mean L3 in external capsule on FA skeleton right - imaging visit - value 0 | 2.30E-09 | 1.3 (0.9, 1.8) | 0.00028 | 33550 19 0 | AU |
| Mean MD in superior corona radiata on FA skeleton left - imaging visit - value 0 | 2.30E-09 | 1.3 (0.89, 1.8) | 0.00028 | 33550 19 0 | AU |
| Mean L2 in external capsule on FA skeleton right - imaging visit - value 0 | 3.60E-09 | 1.3 (0.89, 1.8) | 0.00028 | 33550 19 0 | AU |
| Mean MD in external capsule on FA skeleton left - imaging visit - value 0 | 4.20E-09 | 1.3 (0.88, 1.8) | 0.00028 | 33550 19 0 | AU |
| Mean L2 in external capsule on FA skeleton left - imaging visit - value 0 | 5.40E-09 | 1.3 (0.87, 1.8) | 0.00028 | 33550 19 0 | AU |
| Weighted mean MD in tract superior thalamic radiation left - imaging visit - value 0 | 7.20E-09 | 1.3 (0.86, 1.7) | 0.00028 | 33548 19 0 | AU |
| Weighted mean L3 in tract superior thalamic radiation left - imaging visit - value 0 | 7.70E-09 | 1.3 (0.86, 1.7) | 0.00028 | 33548 19 0 | AU |

1. Shown are quantitative phenotypes with p values below 0.05, sorted by increasing p-value. From left-to-right is the phenotype, the effect size (regression beta on RINT scale [11-13] with 95% confidence interval), the p-value, counts of ref/ref genotypes, counts of ref/alt heterozygous genotypes, and units. AU, arbitrary units.
2. Highlight of phenotypes mentioned in the main text

Supplementary Table 21. *NOTCH3* EGFr Domains¹.

| Domain | Start | End |
|---------------|--------------|------------|
| EGFr 1 | 40 | 77 |

- ¹. To test the combined signal of association of rare *NOTCH3* Cys-altering variants with ischemic stroke in the UKB European population, individual variant data was combined into a burden test. Shown is a table of all Cys-altering variants in *NOTCH3* that were observed in UKB Europeans, including variant functional information, and single variant association summary statistics for variants with alternate allele count (AAC) ≥ 5 . From left-to-right is variant location (in chromosome:position:reference:alternate format with GRCh38 coordinates); exon number; EGFr domain class in *NOTCH3* (1-6, 7-34, or no EGFr domains); specific EGFr number; impact on ENST00000263388 transcript; impact on the protein sequence; single variant analysis effect size (with 95% confidence interval in parenthesis); single variant analysis p value; alternate variant allele frequency; alternate variant allele count; number of cases (organized by Ref/Ref homozygotes | Ref/Alt heterozygotes | Alt/Alt homozygotes); number of controls; alternate allele frequency in the full UKB 450 K cohort across ancestries; and alternate allele frequency in the full 75 K PGR cohort. “NC” stands for “Not Calculated”, meaning that the case and control counts of the variant was insufficient to calculate a single variant analysis p value and effect size. Table is ordered from start to end of transcript.

Supplementary Table 23. Comparison of Cys-altering and Ser-altering Variants in *NOTCH3* EGFr domains in UKB¹.

| Domain | Covariate | Variant group | Phenotype | Odds ratio (CI) | Pval | AAF | Case | Control | Case (n) | Control (n) |
|--------------|----------------------|---------------|-----------------|---------------------|----------|----------|------------|---------------|----------|-------------|
| | | | | | | | (RR RA AA) | (RR RA AA) | | |

¹. To test the hypothesis that all missense variants contribute to the association between *NOTCH3* and stroke, an analysis was conducted to compare the effects of Cys-altering and Ser-altering variants. Serine was selected because it is one of the most common amino acids added or removed in *NOTCH3*, and at *NOTCH3* codon 1231 a second alternate allele introduces an extremely rare Arg->Ser instead of a Arg->Cys

Rodriguez-Flores et al.
NOTCH3 p.Arg1231Cys is Markedly Enriched in South Asians and Associated with Stroke
Version 34
17 June 2024

missense substitution. Shown in this table from left-to-right is a description of the NOTCH3 domains included in the analysis (EGFr domains 1 to 34, 1 to 6, 7 to 34, or the C-terminal region beyond EGFr 34); covariates included; variant group (Cys-altering or Ser-altering); phenotype; effect size (odds ratio with 95% confidence interval in parenthesis); p value; alternate allele frequency; case genotype counts (RR|RA|AA); case total n; control genotype counts (RR|RA|AA); control total n; and a description of the analysis. Results shown for standard covariates.

Supplementary Table 24. *NOTCH3* LoF Variants in UKB Included in Burden Test¹.

¹. To test the hypothesis that loss of function (LoF) variants in *NOTCH3* do not contribute to stroke risk in the UKB European population, individual LoF variants were combined into a burden test. Shown is a table of all LoF variants in *NOTCH3* that were observed in UKB Europeans, including single variant association summary statistics for variants with alternate allele count (AAC) ≥ 5 . From left-to-right is variant location (in chromosome:position:reference:alternate format with GRCh38 coordinates); the exon in the canonical ENST00000263388 transcript; specific EGFr domain number; impact on ENST00000263388 transcript; impact on the protein sequence; single variant analysis effect size (odds ratio with 95% confidence interval in parenthesis); single variant analysis p value; alternate variant allele frequency; alternate variant allele count; number of cases (organized by Ref/Ref homozygotes | Ref/Alt heterozygotes | Alt/Alt homozygotes); number of controls; alternate allele frequency in the full UKB 450 K cohort across ancestries; alternate allele frequency for the variant in 75 K PGR cohort. “NC” stands for “Not Calculated”, meaning that the case and control counts of the variant was insufficient to calculate a single variant analysis p value and effect size. “NA” stands for “not applicable”. Table is ordered from start to end of transcript.

Supplementary Figures

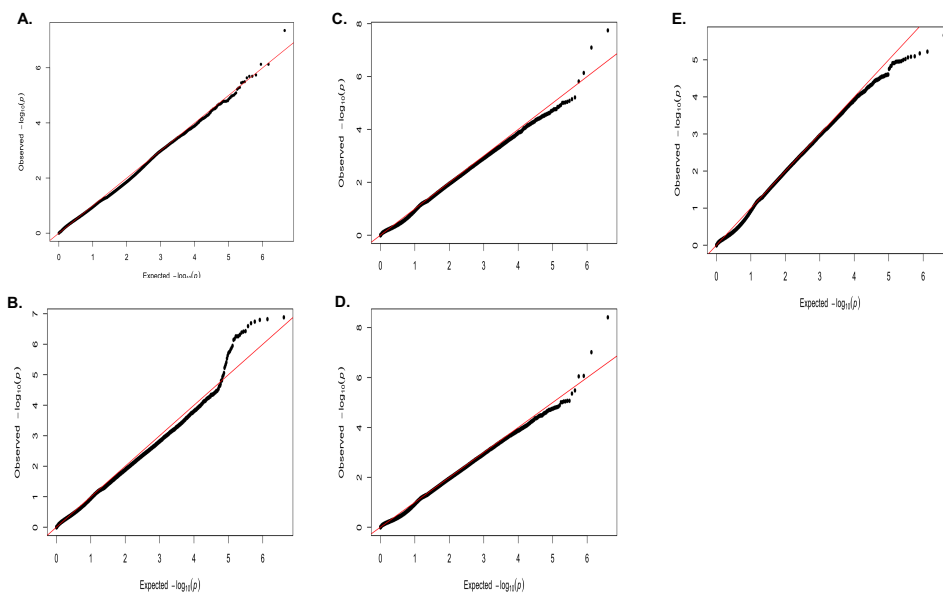

Supplementary Figure 1. Overlap between Cases across 5 Stroke Phenotypes in PGR Discovery Cohort.

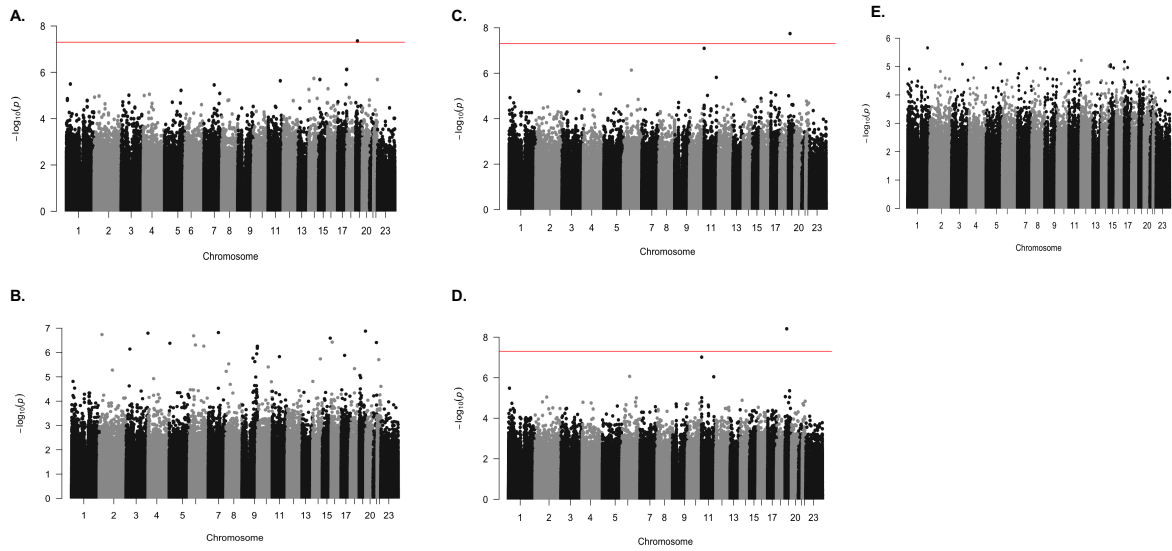

ExWAS was conducted for 5 stroke phenotypes, including the all-inclusive “stroke” (n = 5,135 cases) and 4 sub-phenotypes whose cases are subsets of the “stroke” cases”. While all sub-phenotype cases are subsets of the “stroke” meta-phenotype, there was some overlap between cases for the 4 sub-phenotypes. To visualize the extent of overlap between stroke and 4 sub-phenotypes, a UpSetR plot was generated. At the bottom left is a bar plot illustrating the sample size of each of the 5 stroke case phenotypes ordered from smallest to largest sample size (stroke, ischemic, intracerebral hemorrhage, subcortical intracerebral hemorrhage, PACI). In the bottom right are horizontal lines, where each line represents one intersecting set between two or more sets, with a filled black circle showing presence of the phenotype (row) in the overlapping set and an unfilled grey circle showing non-presence in the intersection set. On top of each intersection line is a bar plot of the intersection size, ordered from left to right from largest to smallest.

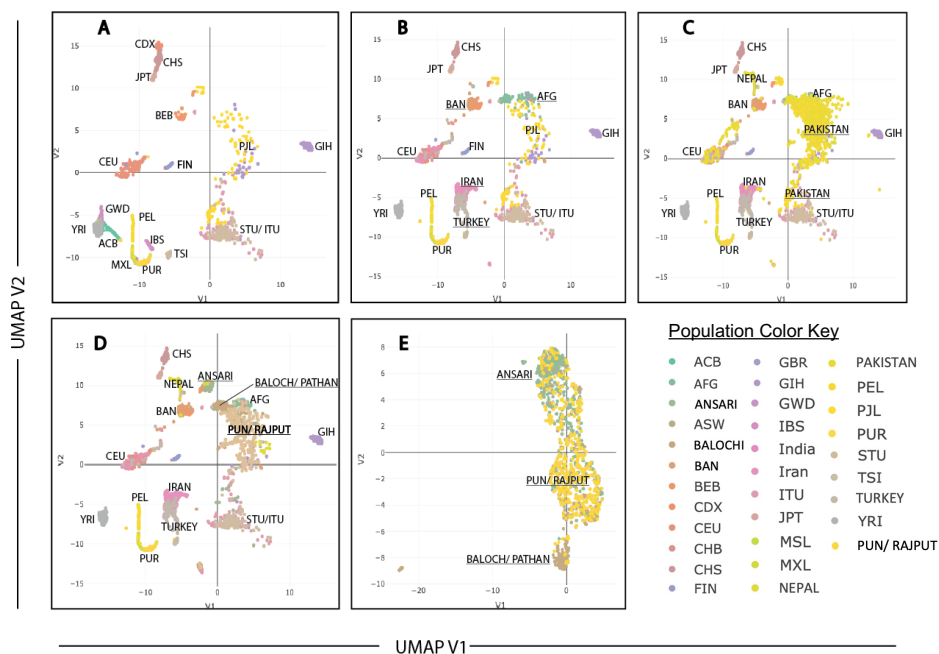

Supplementary Figure 2. Overlap between Subcortical Stroke Cases across 5 Stroke Sub-Phenotypes in PGR Discovery Cohort. To visualize the extent of overlap between subcortical stroke cases (n = 1,388) and 4 other stroke sub-phenotypes (including the meta-phenotype “stroke” of which all 4 sub-phenotypes, including subcortical stroke, are subsets of), an UpSetR plot was generated. At the bottom left is a bar plot illustrating the sample size of each of the 5 stroke case sub-phenotypes ordered from smallest to largest overlap sample size. In the bottom right are horizontal lines, where each line represents one intersection set between two or more sets, with a filled black circle showing presence of the phenotype (row) in the overlapping set and an unfilled grey circle showing non-presence in the intersection set. On top of each intersection line is a bar plot of the intersection size, ordered from left to right from largest to smallest.

Supplementary Figure 3. QQ Plots of 5 Stroke ExWASes in PGR Discovery Cohort. Plot compares observed (y-axis) to expected (x-axis) ExWAS likelihood ratio test $-\log_{10}$ p-values calculated using REGENIE for $n=5,135$ stroke cases and $n=26,602$ controls. **A.** Stroke; **B.** Ischemic; **C.** Hemorrhagic; **D.** Subcortical, **E.** PACI.

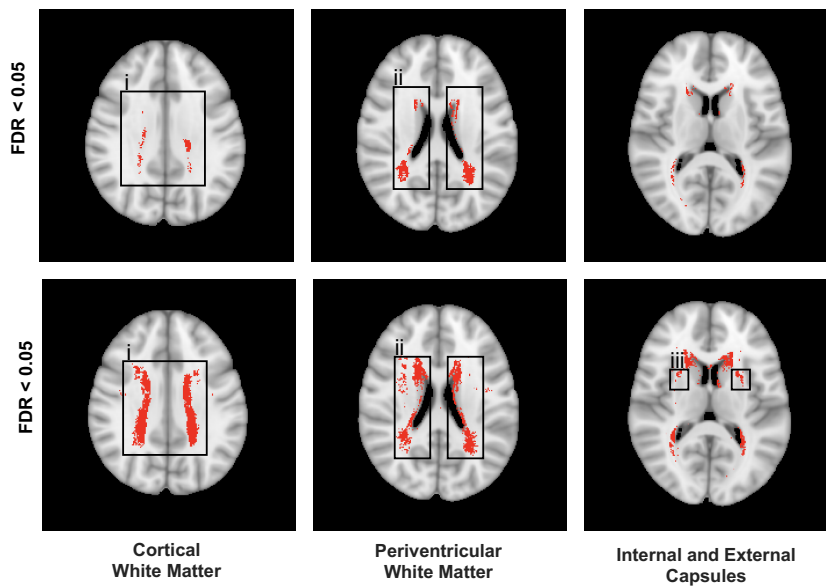

Supplementary Figure 4. Manhattan Plots of 5 Stroke ExWASes in PGR Discovery Cohort. Plot shows the ExWAS likelihood ratio test $-\log_{10} p$ values calculated using REGENIE for $n=5,135$ stroke cases and $n=26,602$ controls (y-axis) versus the position in the genome (x-axis). Alternating colors by chromosome from 1 to 23 (ChrX), with a dotted horizontal line showing the genome-wide significance threshold of 5.0×10^{-8} for ExWASes where at least one variant had a $-\log_{10} p$ value above threshold. **A.** Stroke; **B.** Ischemic; **C.** Hemorrhagic; **D.** Subcortical, **E.** PACI.

Supplementary Figure 5. Population Structure of Pakistan This plot was created using first seven principal components (PCs) computed using genome-wide SNV data from PGR, 1000G and UKB. UMAP is a dimensional reduction technique that can be used to view complex data in two-dimensional space. In this plot the x-axis represents the first dimension and y-axis the second dimension of UMAP. UMAP plot for CNCD data formed three major clusters that were enriched with individuals identifying as Ansari, Punjabi/Rajput and Balochi/Pathan ancestries. **A.** 1000 Genomes Populations. **B.** Same as panel A, with addition of UKB South Asian (SAS) and West Asian (WAS) Populations with $n > 100$. **C.** Same as panel B, with addition of $n = 900$ from PGR cohort. **D.** Same as panel C, with Pakistani ancestry clusters labeled ($n = 300$ Baloch/Pathan, $n = 300$ Punjabi/Rajput, $n = 300$ Ansari). **E.** Focus on the PGR to show the major ancestry clusters. Each color on plot represents an individual ancestry and has been labeled accordingly as described in the Population Color Key. The abbreviations of corresponding ancestries as follow: 1000 Genomes Project African Caribbean in Barbados (ACB), 1000 Genomes Project Bengali in Bangladesh (BEB), 1000 Genomes Project Chinese Dai in Xishuangbanna, China (CDX), 1000 Genomes Project Han Chinese South (CHS), 1000 Genomes Project Finnish in Finland (FIN), 1000 Genomes Project Gujarati Indians in Houston, Texas, USA (GIH), 1000 Genomes Project Gambian in Western Division – Mandinka (GWD), 1000 Genomes Project Iberian Populations in Spain (IBS), 1000 Genomes Project Indian Telugu in the U.K. (ITU), 1000 Genomes Project Japanese in Tokyo, Japan (JPT), 1000 Genomes Project Mexican Ancestry in Los Angeles CA USA (MXL), 1000 Genomes Project Peruvian in Lima Peru (PEL), 1000 Genomes Project Puerto Rican in Puerto Rico (PUR), 1000 Genomes Project Punjabi in Lahore, Pakistan (PJI), 1000 Genomes Project Sri Lankan Tamil in the UK (STU), 1000 Genomes Project Toscani in Italia (TSI), 1000 Genomes Project Yoruba in Ibadan, Nigeria (YRI), UKB Country of birth Afghanistan (AFG) ($n = 112$), UKB Country of birth Bangladesh (BAN) ($n = 246$), UKB Country of birth Iran (IRAN) ($n = 540$), UKB Country of birth Nepal (NEPAL) ($n = 161$), UKB Country of birth Pakistan (PAKISTAN) ($n = 1439$), UKB Country of birth Turkey (TURKEY) ($n = 182$), CNCD Baloch/Pathan (BALOCH/PATHAN) ($n = 3,068$), CNCD Punjabi/Rajput (PUN/RAJPUT) ($n = 20,907$), CNCD (ANSARI) ($n = 10,402$).

Supplementary Figure 6. Evidence for Pathological Changes in Brain of p.Arg1231Cys Carriers. LocusZoom plot of *NOTCH3* for white matter hyperintensity (WMH) in $n = 35,344$ UKB participants. WMH was one of several brain MRI phenotypes with linear regression test p values below 1.0×10^{-5} . Shown is a plot of the $-\log_{10} p$ values (y axis) for all *NOTCH3* exome variants, ordered by position (x axis), with p.Arg1231Cys labeled. Variants represented as triangles color-coded by LD with the index SNP.

Supplementary Figure 7. Voxel-wide Heatmap of White Matter Hyperintensity Signal in *NOTCH3* Cys-Altering Mutation Carriers Compared to Controls from UK Biobank. Shown is the voxel-wide heatmap of white matter hyperintensity (WMH) signal with voxel significant differences calculated by logistic regression in $n = 35,344$ UKB participants with brain MRI data between (*top*) $n = 20$ p.Arg1231Cys carriers vs. controls and (*bottom*) $n = 86$ EGFr Cys-altering variant carriers vs. controls shown in red. (*top*) Signals observed most strongly in (i) the centrum semiovale (cortical white matter) and (ii) the periventricular white matter, to lesser degree in the internal and external capsule white matter. (*bottom*) Signals observed appreciably in (i) the centrum semiovale (cortical white matter), (ii) the periventricular white matter, and (iii) the external capsules bilaterally.
