S-CVI/Ave = 0.958

Note. The item content validity index (I-CVI) is calculated as follows: positive agreements / total experts. Scale content validity index (S-CVI/Ave) is the average of the CVIs divided by the total number of instrument items. The binomial random variable was used to determine Pc (probability of a chance occurrence): $Pc = \frac{[N!/A! (N-A)!]}{0.5^N}$. "N" stands for "number of experts" and "A" stands for "number of experts on good relevance". $I-CVI - Pc / (1 - Pc) = k = \text{kappa}$ denoting agreement on importance. The following values for kappa are considered fair: 0.40 to 0.59; good: of 0.60 to 0.74; and excellent: > 0.74.
