S-FCVI/Ave = 0.994

Note. The I-FVI (item face validity index) is calculated as follows: clear votes / total experts. Average of FVIs / total number of instrument items is the S-FVI. The binomial random variable was used to determine Pc (probability of a chance occurrence): $Pc = [N!/A! (N-A)!] \times 0.5^N$. "N" stands for "number of experts", while "A" stands for "number of experts on good relevance". k stands for agreement on significance. $k = (I-FVI - Pc) / (Pc - 1)$. Kappa is measured using the following criteria: Fair = 80; Medium = 0.80-0.85; and Excellent = 0.85.
