A1, minor allele; A2, major allele; CHR, chromosome; MAF, minor allele frequency

^aMismatch refers to cases in which a recipient who is homozygous for a deletion-tagging allele received a transplant from a donor with a nonhomozygous or homozygous reference allele genotype.

^bSteers NJ, Li Y, Drace Z, et al. Genomic Mismatch at LIMS1 Locus and Kidney Allograft Rejection. *N Engl J Med*. 2019;380(20):1918-1928. doi:10.1056/nejmoa180373

Supplementary Table S2. Summary statistics of adjusted Cox proportional hazards models
analyzing the effect of mismatches in 40 deletion-tagging variants and time to acute
rejection

Eplets total HLAI	1.010(0.981–1.039)	0.512
Eplets total HLAII	1.032(0.992–1.074)	0.121
Year of transplantation	0.983(0.942–1.026)	0.443
Autoimmune liver disease	1.087(0.705–1.675)	0.707
Initial calcineurin inhibitor type: cyclosporine A	2.151(1.128-4.100)	0.020

Supplementary Table S8. Adjusted Cox proportional hazards model for rs1944862 mismatch and time to late rejection.

Autoimmune liver disease was categorized as primary or secondary liver transplantation indication of primary sclerosing cholangitis, primary biliary cholangitis, or autoimmune hepatitis. CI; confidence interval, HR; hazard ration, HLA; human leukocyte antigen.

Covariate	HR (95% CI)	P-value
rs2174926 mismatch	2.332(1.145–4.752)	0.020
Recipient age	0.972(0.947–0.998)	0.034
Donor age	1.030(1.002–1.059)	0.037
Recipient sex	1.157(0.591–2.263)	0.671
Donor sex	1.123(0.569–2.218)	0.738
Cold ischemia time minutes	1.000(0.997–1.003)	0.971
Eplets total HLAI	0.972(0.928–1.017)	0.215
Eplets total HLAII	1.037(0.978–1.101)	0.227
Year of transplantation	0.959(0.890–1.033)	0.266
Autoimmune liver disease	1.941(1.019–3.697)	0.044
Initial calcineurin inhibitor type: cyclosporine A	5.629(1.331-23.809)	0.019

Supplementary Table S9. Adjusted Cox proportional hazards model for rs2174926 mismatch and time to graft loss.

Autoimmune liver disease was categorized as primary or secondary liver transplantation indication of primary sclerosing cholangitis, primary biliary cholangitis, or autoimmune hepatitis. CI; confidence interval, HR; hazard ration, HLA; human leukocyte antigen.

Supplementary Figure S1. Flow of genetic variants in in pre- and post-imputation processes.

MAC, minor allele content; MAF, minor allele frequency; QC, quality control.

Supplementary Figure S2. Kaplan-Meier plot displaying the effect of quartiles of missense variant mismatches of all proteins on late rejection -free survival. The risk table shows the number of recipients in each quartile group that are at risk of late rejection at given time points. The x-axis shows time to event (late rejection or censoring) and the y-axis rejection-free survival. The presented hazard ratio, confidence intervals and P-value were calculate using Cox proportional hazards model with adjusted covariates: recipient and donor age, recipient and donor sex, cold ischemia time, HLA I eplet mismatch, HLA II eplet mismatch, year of transplantation, autoimmune liver disease and initial calcineurin inhibitor type. CI, confidence interval; HR, hazard ratio; MM, missense variant mismatch; Q1, quartile 1; Q2, quartile 2; Q3, quartile 3; Q4, quartile 4.

Supplementary Figure S3. Kaplan-Meier plot displaying the effect of quartiles of missense variant mismatches of transmembrane proteins only on graft loss -free survival. The risk table shows the number of recipients in each quartile group that are at risk of graft loss at given time points. The x-axis shows time to event (graft loss or censoring) and the y-axis rejection-free survival. The presented hazard ratio, confidence intervals and P-value were calculate using Cox proportional hazards model with adjusted covariates: recipient and donor age, recipient and donor sex, cold ischemia time, HLA I eplet mismatch, HLA II eplet mismatch, year of transplantation, autoimmune liver disease and initial calcineurin inhibitor type. CI, confidence interval; HR, hazard ratio; MM, missense variant mismatch; Q1, quartile 1; Q2, quartile 2; Q3, quartile 3; Q4, quartile 4.

Supplementary Figure S4. Kaplan-Meier plot displaying the estimated probability of acute rejection -free survival in quartiles of overall deletion mismatch sums between recipients and donors. Del sum collision value indicates the number of deletion-tagging variant genotype mismatches between recipients and donors. The risk table shows the number of recipients in each quartile group that are at risk of AR at given time points. The presented hazard ratio, confidence intervals and P-value were calculate using Cox proportional hazards model with adjusted covariates: recipient and donor age, recipient and donor sex, cold ischemia time, HLA I eplet mismatch, HLA II eplet mismatch, year of transplantation, autoimmune liver disease and initial calcineurin inhibitor type. Cl, confidence interval; HR, hazard ratio; Q1, quartile 1; Q2, quartile 2; Q3, quartile 3; Q4, quartile 4.

Supplementary Figure S6. Kaplan-Meier plot displaying the estimated probability of graft loss -free survival in quartiles of overall deletion mismatch sums between recipients and **donors.** Del sum collision value indicates the number of deletion-tagging variant genotype mismatches between recipients and donors. The risk table shows the number of recipients in each quartile group that are at risk of graft loss at given time points. The presented hazard ratio, confidence intervals and P-value were calculate using Cox proportional hazards model with adjusted covariates: recipient and donor age, recipient and donor sex, cold ischemia time, HLA I eplet mismatch, HLA II eplet mismatch, year of transplantation, autoimmune liver disease and initial calcineurin inhibitor type. Cl, confidence interval; HR, hazard ratio; Q1, quartile 1; Q2, quartile 2; Q3, quartile 3; Q4, quartile 4.

Supplementary Figure S7. Kaplan-Meier plot displaying the estimated probability of overall survival in quartiles of overall deletion mismatch sums between recipients and donors. Del sum collision value indicates the number of deletion-tagging variant genotype mismatches between recipients and donors. The risk table shows the number of recipients in each quartile group that are at risk of death at given time points. The presented hazard ratio, confidence intervals and P-value were calculate using Cox proportional hazards model with adjusted covariates: recipient and donor age, recipient and donor sex, cold ischemia time, HLA I eplet mismatch, HLA II eplet mismatch, year of transplantation, autoimmune liver disease and initial calcineurin inhibitor type. Cl, confidence interval; HR, hazard ratio; Q1, quartile 1; Q2, quartile 2; Q3, quartile 3; Q4, quartile 4.
