1 Table S1. Comparison between our study with X chromosome and previous works that have

		Henningsson et al., 2009	Wang et al., 2009	Chung et al., 2011	Ramos et al., 2012	Our study
P	UBMED	19167832	19404256	22050706	22681640	
	Target trait	Autism	Autism	Autism	Autism	Autism
	"Case" Samples	267	3,101 subjects and a second cohort of 1,204 affected subjects	894 ASD families (3,128 individuals) + 939 ASD families (4,495 individuals) + 1,204 cases	1,510 trios	6,873
	"Control" Samples	617	6,491	6,472	Family based test	8,981
	Sample's global ancestry	204 from the Paris Autism Research International Sib-pair (PARIS) study and 63 came a separate Swedish cohort.	European ancestry	Self-reported Caucasian ancestry.	European descent (76%),with Asian (3%) and African (2%)	European (samples with more than 75% of european ancestry)
Methods	Genetic Markers	Genotyped for three polymorphisms in exon 1 of the AR gene	486,864 markers in all genome (not only on X chromosome)	Genotyped data (~13,837 X- chromosome SNPs)	22,904 single nucleotide polymorphisms (SNPs) from the 2,012 immune related genes	418,876 variants only in the X-chromosome
	Association Test Method	Case-Control Comparison plus Transmition Desequilibrium test	Genome-wide association, plus family-based association test using X-APL.	Meta-analysis and joint analysis. genome-wide association study (GWAS) data on the X chromosome in three independent autism GWAS data sets.	Family-based tests of association.	XWAS
	Results	Case-control comparisons revealed higher prevalence of short CAG alleles as well as of the A allele of the rs6152 SNP in female cases than in controls, but revealed no significant differences with respect to the GGN repeat.	RHOXF1 (combined pvalue 9.7×10-7), Between PRKX and NLGN4X (combined pvalue 9.0×10-7), DMD (combined pvalue 2.7×10-7).	One SNP, rs17321050, in the transducin b-like 1X-linked ( <i>TBLIX</i> ) gene showed chromosome-wide significance in the meta-analysis (P value = 4.86 × 10-6) and joint analysis (P value = 4.53 × 10-6) in males.	Significant associations in the CD99 molecule- like 2 region (CD99L2,rs11796490, P= 4.01 × 10-06, OR = 0.68 (0.58-0.80))	Detected 59 candidate
Co	onclusion	The results lend some support for an influence of the studied polymorphisms on the susceptibility for autism, but argue against the possibility that mutations in the AR gene are common in subjects with this condition.	The first demonstration of genome-wide significant association of common variants with susceptibility to ASDs including X chromosome.	Our results, based on meta- analysis, joint analysis and replication analysis, suggest that <i>TBL1X</i> may play a role in ASD risk.	Several novel genes with known immune functions are associated with ASD.	First XWAS using WGS data in Autism, finding variants in 6 ASD-genes plus 8 new ASD-genes candidates.

2 used similar approaches for common variants.

3

**Table S2.** Significant associated variants with the respective P-Value from all different XWAS
(XWAS-Males, XWAS-Females, XWAS-Both, XWAS-Meta).

Table S3. Significant associated variants with the respective P-Value from all different XWAS
(XWAS-Males, XWAS-Females, XWAS-Both, XWAS-Meta) from all replication tests: i.
MSSNG as case vs HostSeq and MGRB as controls; ii. SSC as case vs HostSeq and MGRB
as controls; iii. SPARK as case vs HostSeq and MGRB as controls; iv. MSSNG, SSC and
SPARK as cases vs HostSeq as controls; v. MSSNG, SSC and SPARK as case and MGRB
as controls.

**Table S4.** Significant associated variants with the respective P-Value from all different XWAS
(Male-XWAS, female-XWAS, Both-XWAS and Meta-XWAS) when using the 10 top autosomal
principal components as covariates.

15 **Table S5.** The 91 mapped genes (10kb distance) based on the XWAS significant variants. In

16 red are highlighted the genes previously associated with ASD on both SFARI and Autdb, and

17 in yellow the genes that was presented in at least one of those 2 autism gene score systems.

- Figure S1. Quality Control specifications. The number of samples and variants remaining
  after each quality control step for autosomes and the X chromosome are shown on the left and
- 27 right, respectively.

Total

Figure S2. P-value and OR Histograms. Each panel shows the p-value histogram (right part)
and OR histogram (left part) resultant from our XWAS analysis for (A) Males-XWAS, B)

- 31 Females-XWAS, C) Both-XWAS, and D) the Meta-XWAS, a meta-analysis from the sex
- 32 stratified approaches implemented on GWAMA.

33

Figure S3. Correlation between XWAS results using PCs from Autosomal and X chromosomal data. A) Correlation between PC1 and PC2 from Autosomal chromosomes on the horizontal axis and X chromosome in the vertical axis, in blue from males and in pink from females. B) Correlation between p-value results coming from XWAS using Autosomal data for PCs inference on the horizontal axis and XWAS using X chromosome data for PCs inference on the vertical axis.

Figure S4. Each panel shows the Manhattan (right part) and qqPlot (left part) resultant from
our XWAS analysis using the top 10 autosomal Principal Components as covariates (A) Males-

- 43 XWAS, B) Females-XWAS, C) Both-XWAS, and D) the Meta-XWAS, a meta-analysis from the
- 44 sex stratified approaches implemented on GWAMA.
