

Supplementary Figure 1 – A) Simulation of stability results for different thresholds of Tremor/PIGD score in the definition of Tremor-Dominant & PIGD scores. Circles: Criteria typically used. Changing thresholds will change stability, but with significant changes in the number of patients included in each group. Inset: Percentage of subjects classified in each category. A decrease in TD patients is accompanied by a progressive increase in the PIGD classification. B) Top: Distribution of the differences in the individual probability of responses between Y4 and Y3 and shuffle control. Bottom: Probability of no change in therapeutic response is significantly higher than randomly expected across timepoints. Black line represents the average of simulated sham distributions and shaded area represents the 95% Confidence Interval of this distribution. * $p < 0.05$ vs. shuffle

Supplementary Figure 2 – A) MDS-UPDRS Part II Scores; Tremor – Kruskal Wallis, $F(2,331)=64.58$, $p<0.001$, post-hoc: No tremor vs. Improvement: $p<0.001$; No tremor vs. resistant $p<0.001$; Improvement vs. persistent: $p=0.5604$; MDS-UPDRS Part II Total: – Kruskal Wallis, $F(2,330)=3.483$, $p=0.1752$; B) Top: SCOPA score for each symptom domain. Urinary – Kruskal Wallis $F(2,330)=0.1773$, $p=0.9164$; Sexual – Kruskal Wallis $F(2,330)=0.5651$, $p=0.7539$; Total – Kruskal Wallis $F(2,330)=3.865$, $p=0.1448$; Bottom: % of patients with SCOPA subdomains score > 1 Urinary – Fisher Exact Test, $p=0.0083$; Sexual – Chi-Squared=2.279, $p=0.3199$; Total – Fisher Exact Test $p>0.999$; C) Top: MOCA score - Kruskal Wallis $F(2,329)=0.7783$, $p=0.6776$, Bottom: % of patients with MOCA < 26: Chi-Squared=0.0156, $p=0.9922$; D) Cumulative distribution of Striatal and Putaminal binding potential, normalized to total BP in the 3 cohorts. E) Cumulative distribution of caudate and putamen volumes asymmetry. F) Cumulative distribution of amygdala volume asymmetry, normalized to total volume of gray and white matter in the 3 cohorts.
