

Table 2. PRS Associations. Test statistics from logistic regression testing the associations between suicide outcomes and PRS for suicide outcomes. Values in parentheses represent test statistics after controlling for BD, DEP, and SCZ PRS (multi PRS model). Bold indicates significance, * indicates significant associations in the single PRS model, and ** indicates significant associations in the multi PRS model. We used a Bonferroni-corrected p-value threshold of $8.33E-3$. PRS = polygenic risk score, SB = suicidal behavior, SI = suicidal ideation, SA = suicide attempt

Outcome	PRS	Beta	SE	P	Liability R2 %	N Cases	N Controls	Effective N
SB vs. controls	SA	0.178 (0.153)	0.04 (0.053)	9.93E-06* (1.81E-04)**	0.325 (0.240)	1,051	42,330	4,079.991
SB vs. controls	SI	0.122	0.053	0.021	0.066	1,051	42,330	4,079.991
SI-only vs. controls	SA	0.092	0.044	0.035	0.146	883	42,330	3,446.367
SI-only vs. controls	SI	0.155 (0.141)	0.057 (0.058)	6.82E-03* (0.015)	0.257 (0.207)	883	42,330	3,446.367
SB vs. SI-only	SA	0.089	0.060	0.137	0.160	1,051	883	1,918.224
SB vs. SI-only	SI	-0.036	0.075	0.633	0.178	1,051	883	1,918.224
