

Supplementary Fig.1: Relationship between p-values and the distance from SNP to DNAm site in the AA and EA populations. The scatter plots depict the association between the distance from the SNP to the DNAm site (measured in base pairs, bp) and the corresponding $-\log_{10}(\text{p-values})$ for the detected meQTLs in the AA (left panel) and EA (right panel) populations. Higher values indicate more significant meQTL associations.
