

Table S4. Residual variability analysis using generalized estimating equations

Analysis	Coefficients				Working correlation
	OCT-VF effect* (95% CI)	Number of tests	Follow-up duration	Age	
24-2 Thresholds	-1.41 (-1.46, -1.36)	-0.0127	-6.50×10 ⁻⁶	0.0083	0.289
24-2 MD	-0.531 (-0.575, -0.486)	-0.0098	1.36×10 ⁻⁵	0.0066	0.216
10-2 Thresholds	-1.24 (-1.30, -1.17)	-0.0133	-7.36×10 ⁻⁵	0.0101	0.277
10-2 MD	-0.306 (-0.368, -0.244)	-0.0132	5.16×10 ⁻⁵	0.0059	0.192

OCT = optical coherence tomography; OCT-VF = OCT-based estimated visual field; HFA = Humphrey Field Analyzer; MD = mean deviation.

*Coefficient represents the difference between OCT-VF and HFA. Negative values indicate lower residual variability for OCT-VF. All $p < 0.001$ obtained from Generalized Estimating Equations with Bonferroni correction.
