

## Supplemental Material

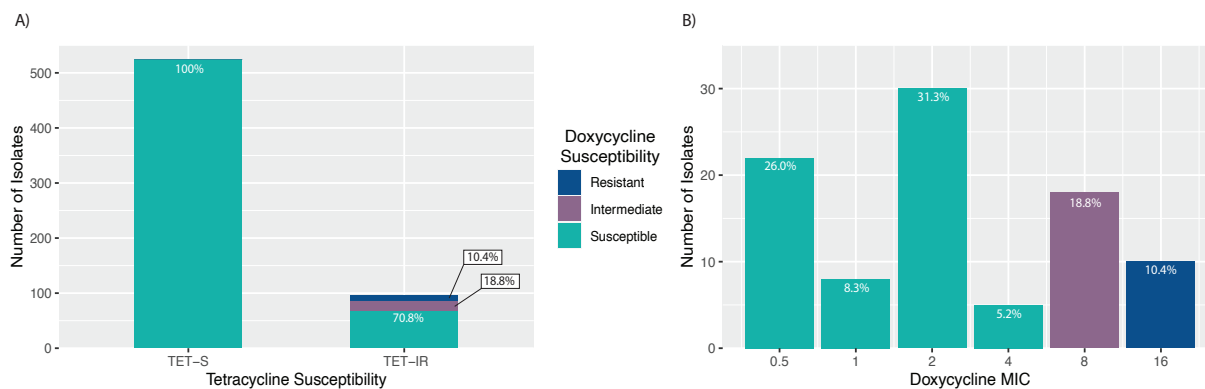

### Figure S1: Resistance Trends in *S. aureus* from 2015 – 2022

The percentage of *S. aureus* isolates in our cohort resistant to clindamycin, doxycycline, oxacillin, tetracycline, and TMP/SMX between June 1, 2015, and May 2, 2022. TMP/SMX = trimethoprim-sulfamethoxazole. This figure was prepared in R (version 4.1.2, R Core Team 2021)<sup>1</sup> using the *tidyverse*<sup>2</sup> and *jtools*<sup>3</sup> packages.

### Figure S2: Correlation of Tetracycline Resistance to Doxycycline Resistance

**A.** Counts and percentages of *S. aureus* isolates that are susceptible to tetracycline (TET-S, MIC  $\leq$  4.0  $\mu\text{g}/\text{mL}$ ) or intermediate/resistant to tetracycline (TET-IR, MIC  $\geq$  8.0  $\mu\text{g}/\text{mL}$ ) and susceptible (MIC  $\leq$  4.0  $\mu\text{g}/\text{mL}$ ), intermediate (MIC = 8), or resistant (MIC  $\geq$  16  $\mu\text{g}/\text{mL}$ ) to doxycycline. **B.** A magnified view of counts and percentages of tetracycline intermediate/resistant isolates by doxycycline minimum inhibitory concentrations. All isolates described in Panel B have a tetracycline MIC  $\geq$  8.0  $\mu\text{g}/\text{mL}$ . Only 29.2% of tetracycline non-susceptible isolates were also doxycycline non-susceptible. This figure was prepared in R (version 4.1.2, R Core Team 2021)<sup>1</sup> using the *tidyverse*<sup>2</sup> package.

**Table S1: Number of Specimens Contributed per Patient**

This table describes the number of isolates contributed per patient. 543 total patients contributed 832 total specimens, with a mean number of 1.53 isolates per patients. 390 patients contributed 1 specimen, 87 patients contributed 2 specimens, 40 patients contributed 3 specimens, etc. Clinical records of patients contributing more than 10 specimens were manually reviewed. In two cases, review indicated patients with 20 specimens had chronic infection or colonization with *S. aureus*, in which the specimens did not reflect distinct episodes of acute infection. In these cases, only unique strains of *S. aureus* were included in the final analysis, reducing the total number of specimens from these patients to 6 each.

Number of Specimens Contributed per Patient	Number of Patients
1	390
2	87
3	40
4	7
5	9
6	7
7	0
8	1
9	1
10	0
11	0
12	0
13	0
14	0
15	0
16	1

**Table S2: *Staphylococcus aureus* specimen types in the study cohort.**

<b>Specimen Type</b>	<b>Number (Percentage)</b>
Skin/Soft Tissue	280 (33.7%)
Abscess	162 (19.5%)
Pulmonary	126 (15.1%)
Blood	83 (10.0%)
Urine	29 (3.5%)
Bone/Joint	28 (3.4%)
Other	4 (0.5%)
Uncategorized	120 (14.4%)
Total	832

## Resistance in the study cohort relative to 2022 institutional resistance

Antibiograms at the Brigham and Women’s Hospital and Massachusetts General Hospital are prepared using the isolate de-duplication methodology advised in the CLSI M39 document.<sup>4</sup> These guidelines recommend capturing only the first isolate from a given patient in a calendar year regardless of strain or body site. As described in the main text, we de-duplicated our isolates using a method intended to capture each unique episode of infection. **Table S3** compares our cohort to the institutional antibiograms when our cohort is de-duplicated via the per-infection method and the institutional antibiograms are de-duplicated via the CLSI method. **Table S4** compares rates of resistance when both our cohort and the institutional antibiograms are de-duplicated via the CLSI method. The CLSI method is more restrictive and identified only 623 unique specimens in our cohort compared to 832 specimens identified by the per-infection method described in the main text, reducing statistical power.

**Table S3: Resistance in our study cohort (de-duplicated via the per-infection method) relative to institutional resistance (de-duplicated by the CLSI method)**

Antibiotic	Resistance in Study Cohort	Institutional Resistance	OR (95% CI, p-value)
Tetracycline	123/829 (14.8%)	244/2300 (10.6%)	1.47 (1.15 – 1.86, p = 0.002)
Doxycycline	28/620 (4.5%)	104/3477 (3.0%)	1.53 (0.96 – 2.37, p = 0.06)
Oxacillin	374/827 (45.2%)	1492/5777 (25.8%)	2.37 (2.04 – 2.76, p < 0.001)
Trimethoprim-sulfamethoxazole	99/829 (11.9%)	316/5777 (5.5%)	3.24 (1.83 – 2.99, p < 0.001)
Clindamycin	283/831 (34.1%)	1573/5777 (27.2%)	1.38 (1.18 – 1.61, p < 0.001)

**Table S4: Resistance in the study cohort relative to institutional resistance in 2022 when both are de-duplicated using the CLSI method.**

Antibiotic	Resistance in Study Cohort	Institutional Resistance	OR (95% CI, p-value)
Tetracycline	81/620 (13.1%)	244/2300 (10.6%)	1.27 (0.96 – 1.67, p = 0.10)
Doxycycline	21/455 (4.6%)	104/3477 (3.0%)	1.57 (0.92 – 2.56, p = 0.09)
Oxacillin	267/619 (43.1%)	1492/5777 (25.8%)	2.18 (1.83 – 2.59, p < 0.001)
Trimethoprim-sulfamethoxazole	68/620 (11.0%)	316/5777 (5.5%)	2.12 (1.59 – 2.82, p < 0.001)
Clindamycin	202/622 (32.5%)	1573/5777 (27.2%)	1.29 (1.07 – 1.54, p = 0.006)
