Supplementary Table 6: Input variables and their missing rates

	Definition of variables	Missing values	%
Variables		(N=1791)	Missing
Recipient gender	Sex (Recipient)	0	0
Recipient age	Age (Recipient)	0	0
WBC	White Blood cell (WBC)	73	3.8
platelets	Platelets	79	4.1
Creatinine	Serum Creatinine	75	3.9
INR	International normalized ratio	100	5.3
Albumin	Serum Albumin	407	21.5
Sodium	Serum Sodium (Na)	71	3.7
Tacrolimus serum level	Tacrolimus serum level	397	21
Cyclosporine serum level	Cyclosporine serum level	397	21
Hemoglobin	Hemoglobin	72	3.8
Bilirubin	Serum Total bilirubin	82	4.3
AST	Aspartate aminotransferase (AST)	72	3.8
ALT	Alanine aminotransferase (ALT)	60	3.1
ALP	Alkaline phosphatase (ALP)	67	3.5
MELD score	MELD score	0	0
Transplant primary indication	Primary indication for transplant	0	0
Donor Type (LDLT vs DDLT)	Living vs deceased donor	0	0
Weight	Weight (kg)	0	0
BMI	Body Mass Index (BMI)	0	0
Diabetes Mellitus	Diabetes Mellitus at transplant (Yes/No)	0	0
Hypertension	Hypertension at transplant (Yes/No)	0	0
Dyslipidemia	Dyslipidemia at transplant (Yes/No)	0	0

Subgroup analysis based on primary indication for LT (HCV vs non-HCV):

In this study, we conducted a subgroup analysis based on the primary indication for liver transplantation (LT), specifically comparing patients transplanted for hepatitis C virus (HCV)-related liver disease to those with non-HCV etiologies. The purpose of this analysis was to assess the impact of the primary indication for transplant on the prediction of graft injury categories.

For the non-HCV cohort, we included 1,322 patients with acute cellular rejection (ACR), 102 with alloimmune hepatitis (AIH), 333 with biliary obstruction (BO), 112 with congestion, and 129 with metabolic associated steatohepatitis (MASH). As there was no HCV graft injury category for patients in the non-HCV primary transplant indication group, we retrained our model to test its performance on five graft injury categories (ACR, AIH, BO, congestion, and MASH) for this subgroup. In contrast, the HCV cohort comprised 566 patients with ACR, 82 with AIH, 147 with BO, 51 with congestion, 2,181 with recurrent HCV, and 119 with MASH. This stratification allowed us to compare the model's performance across different graft injury categories for both HCV and non-HCV patients, ensuring that our model remains robust and generalizable to modern transplant populations, where HCV is less prevalent.

Supplementary Table 7: Comparison of AUC values for the multiclass neural network (NN)-based machine learning (ML) model in predicting graft injury categories in HCV and non-HCV liver transplant recipients. The table shows the model's performance across six categories: Acute Cellular Rejection (ACR), Alloimmune Hepatitis (AIH), Biliary Obstruction (BO), Congestion, HCV recurrence, and Metabolic Associated Steatohepatitis (MASH). AUC values demonstrate consistent model performance across both HCV and non-HCV cohorts, indicating the model's robustness.

Category	AUC multiclass NN based ML model	AUC multiclass NN based ML model
	Primary indication of transplant HCV	Primary indication of transplant Non-HCV
ACR	0.781	0.769
AIH	0.919	0.907
ВО	0.908	0.896
Congestion	0.915	0.903
HCV	0.864	-
MASH	0.910	0.902
