

## Supplementary Information

### Materials and Methods

#### Data curation

The cellular indexing of transcriptomes and epitopes sequencing (CITE-seq) dataset analyzing healthy European American/White (EA) and African American/Black (AA) individuals was downloaded from the original publication<sup>1</sup> (GEO ID: GSE189050). For transcriptomic datasets, 8 asthma-related studies with ethnicity/race-related information were found on Gene Expression Omnibus (GEO, Table S1). 2 studies did not report clear ethnicity/race classification and 1 study only contained 1 AA sample. They are thus excluded. The remaining 5 datasets of high data quality and good sample ethnicity/race coverage were subject to analyses using their corresponding normalized data. For the longitudinal dataset, we only focused on the regular visit timepoints for their better data coverage and more consistent comparison as samples from exacerbation and follow-up timepoints were sporadic and analysis might be affected by bias or outliers.

**Table S1.** Overview of the asthma transcriptomic datasets used in current study.

## Bioinformatic analysis

CITE-seq data were analyzed with *Seurat* v4.3.0.<sup>7</sup> In brief, PBMC subsets were annotated by the original publication and gene set scores were calculated using the *CellCycleScoring* function in *Seurat* based on the “IL2\_STAT5\_SIGNALING” gene set documented in Gene Set Enrichment Analysis (GSEA, <https://www.gsea-msigdb.org/gsea/msigdb/human/search.jsp>)<sup>8</sup>. Transcriptomic datasets were analyzed with GSEA<sup>8</sup> following its tutorial. For the analysis for “CELL\_ADHESION & MIGRATION” gene set, the corresponding genes were adapted from the original publication<sup>9</sup>. Gene set variation analysis (GSVA)<sup>10</sup> was run following its tutorial based on the “IL2\_STAT5\_SIGNALING” gene set.
