

Supplemental Materials:
**The Two-dose MVA-BN Mpox Vaccine Induces a Nondurable and Low Avidity
MPXV-specific Antibody Response**

Aaron L. Oom, Kesi K. Wilson, Miilani Yonatan, Stephanie Rettig, Heekoung Allison Youn, Michael Tuen, Yusra Shah, Ashley L. DuMont, Hayley M. Belli, Jane R. Zucker, Jennifer B. Rosen, Ramin Sedaghat Herati, Marie I. Samanovic, Ralf Duerr, Angelica C. Kottkamp, and Mark J. Mulligan on behalf of the NYC OSMI Study Group

Table S1: Sample information for convalescent participants.

Participant	Age Range	Prior Smallpox Vaccination	HIV Status	Received Tecovirimat?	Dose 1 DPO	Dose 1 Route	Dose 2 DPO	Dose 2 Route	Sample DPO
Conv 1	40-50	No	PWH	Yes	-25	SC	46	ID	340
Conv 2	30-40	No	HIV uninfected	No	9	SC	87	ID	336
Conv 3	20-30	No	HIV uninfected	Yes	-1	SC			386
Conv 4	40-50	No	PWH	Yes	78	ID			388
Conv 5	30-40	No	PWH	Yes					335
Conv 6	50-60	Yes	PWH	Yes					338
Conv 7	60-70	Yes	PWH	No					391
Conv 8	60-70	Yes	PWH	No					433
Conv 9	30-40	No	PWH	No					386

Participants above the horizontal line received one or two doses of MVA-BN.

Conv, convalescent; PWH, person with HIV; SC, subcutaneous; ID, intradermal; DPO, days post-symptom onset.

Table S2: CD4 counts at time of enrollment for OSMI participants with HIV.

Naïve CD4 Counts	Exp CD4 Counts
267	284
321	350
347	351
491	438
500.5	450
574.5	482.5
576	538.5

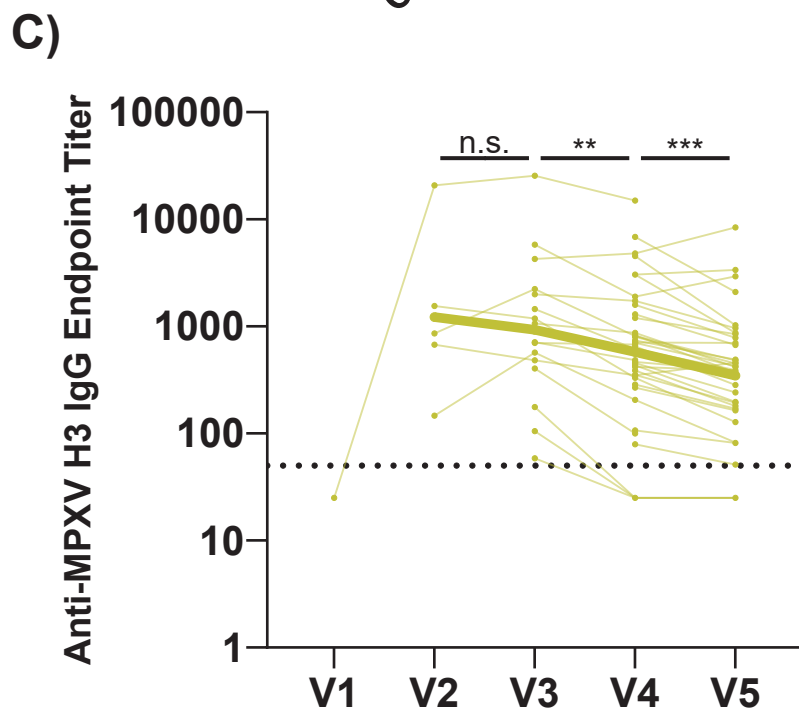

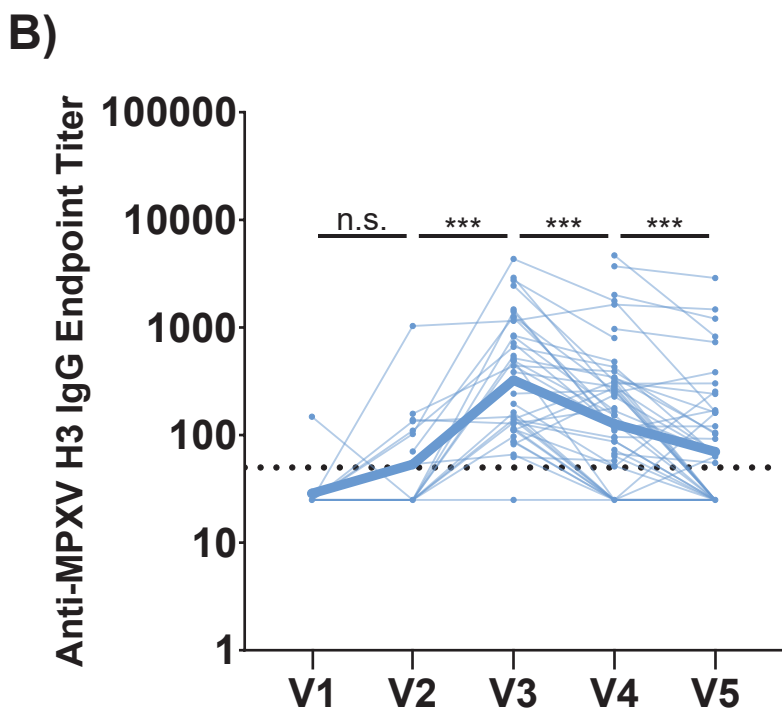

Figure S1: Anti-MPXV H3 binding titers follow the general trends of MPXV neutralizing titers. A) Serum anti-MPXV H3 IgG titers were measured by ELISA across all participants and study visits. Colored/black bars on each group indicate the geometric mean titer. Horizontal, dashed black line indicates the limit of detection (endpoint titer of 50) for the assay. Any values below the LoD are denoted as an endpoint titer of 25. B and C) Paired anti-MPXV H3 IgG endpoint titers by visit for naïve (B) or experienced (C) participants. Bolded line in panels B and C indicates the mean titer at each time point. Statistical testing conducted by Kruskal-Wallis test with Dunn's method for multiple comparisons for panel A, and by Wilcoxon matched-pairs signed rank test for panels B and C.

A)

B)

Figure S2: Neutralizing titers elicited by MVA-BN are statistically similar between PWH and HIV-uninfected individuals. A) Aggregate MPXV neutralizing titer data for V4 stratified first by prior smallpox vaccination then by HIV status. Colored/black bars on each group indicate the geometric mean titer. Serum neutralizing titers were measured by a fluorescence-based microneutralization assay using authentic clade IIb MPXV. Horizontal, black dashed line in each panel indicates the positivity threshold for neutralization (Fig. 2). B) Same as A, but for V5. Statistical testing conducted by Kruskal-Wallis test with Dunn's method for multiple comparisons.

A)

B)

Figure S3: Neutralizing titers elicited by intradermal MVA-BN are statistically similar between PWH and HIV-uninfected individuals. A) Aggregate MPXV neutralizing titer data of participants that received at least one dose of MVA-BN intradermally. Titers for V4 are stratified first by prior smallpox vaccination then by HIV status. Colored/black bars on each group indicate the geometric mean titer. Serum neutralizing titers were measured by a fluorescence-based microneutralization assay using authentic clade IIb MPXV. Horizontal, black dashed line in each panel indicates the positivity threshold for neutralization (Fig. 2). B) Same as A, but for V5. Statistical testing conducted by Kruskal-Wallis test with Dunn's method for multiple comparisons.

Figure S4: MPXV neutralizing titers wane significantly faster in naïve MVA-BN vaccinees. Comparison of the paired fold changes in neutralizing titers from Fig. 2B and C. Colored/black bar for each group indicates the geometric mean fold change. Statistical testing conducted by Kruskal-Wallis test with Dunn's method for multiple comparisons.

Naïve

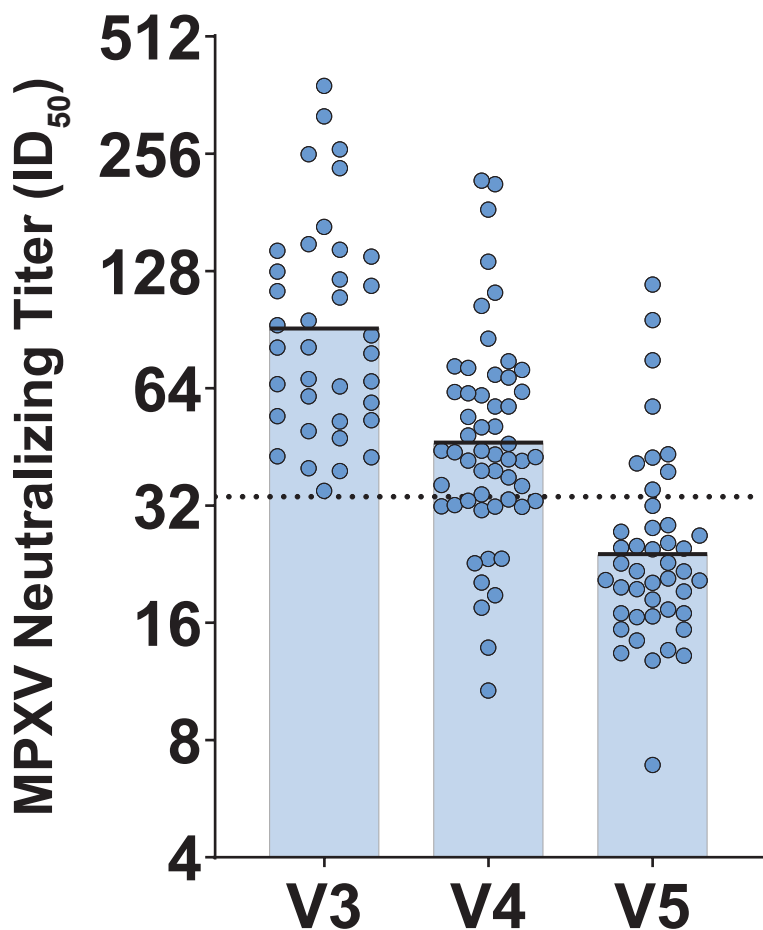

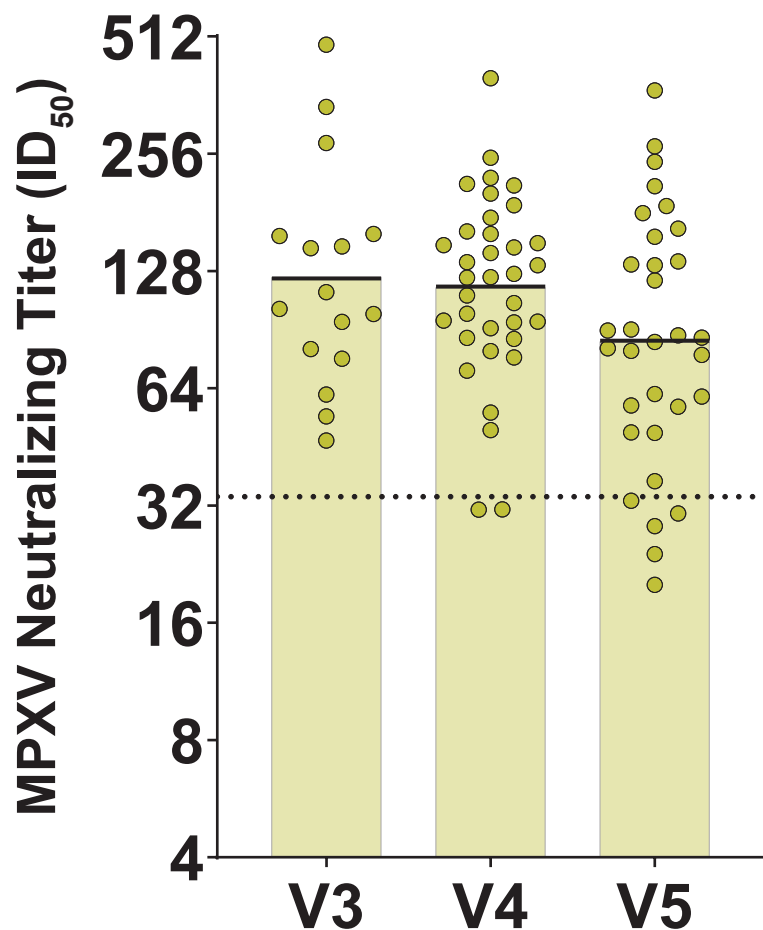

Figure S5: Longer dosing intervals significantly correlate with peak MPXV neutralizing titers in naïve MVA-BN vaccinees. Linear regression of V3 MPXV neutralizing titers versus dosing interval in VACV-naïve participants.

A)

	Naïve V3	Naïve V4	Naïve V5
N	37	54	44
GMT (95% CI)	91.1 (73.9-112.3)	46.4 (39.2-54.9)	24.0 (20.4-28.3)
Median DPV2 (IQR)	19 (15-25)	82 (72-97)	294 (275-304)
% Neg	0	29.6	81.8

B)

	Exp V3	Exp V4	Exp V5
N	16	35	32
GMT (95% CI)	122.4 (86.5-173.3)	116.7 (96.7-140.8)	84.8 (65.0-110.7)
Median DPV2 (IQR)	21 (18-29)	81 (74-92)	286 (267-313)
% Neg	0	5.7	15.6

● No Prior Smallpox Vaccination

● Prior Smallpox Vaccination

Figure S6: Subsets for multiplexed immunoassay analysis have similar neutralization to overall study groups. A) Aggregate MPXV neutralizing titer data for naïve group subset used in Figures 4 and 5. Serum neutralizing titers were measured by a fluorescence-based microneutralization assay using authentic clade IIb MPXV. Colored/black bars on each group indicate the geometric mean titer. Horizontal, black dashed line indicates the positivity threshold for neutralization (Fig. 2). B) Same as A, but for experienced participants. Exp, experienced vaccinees (prior history of smallpox vaccination).

A)

B)

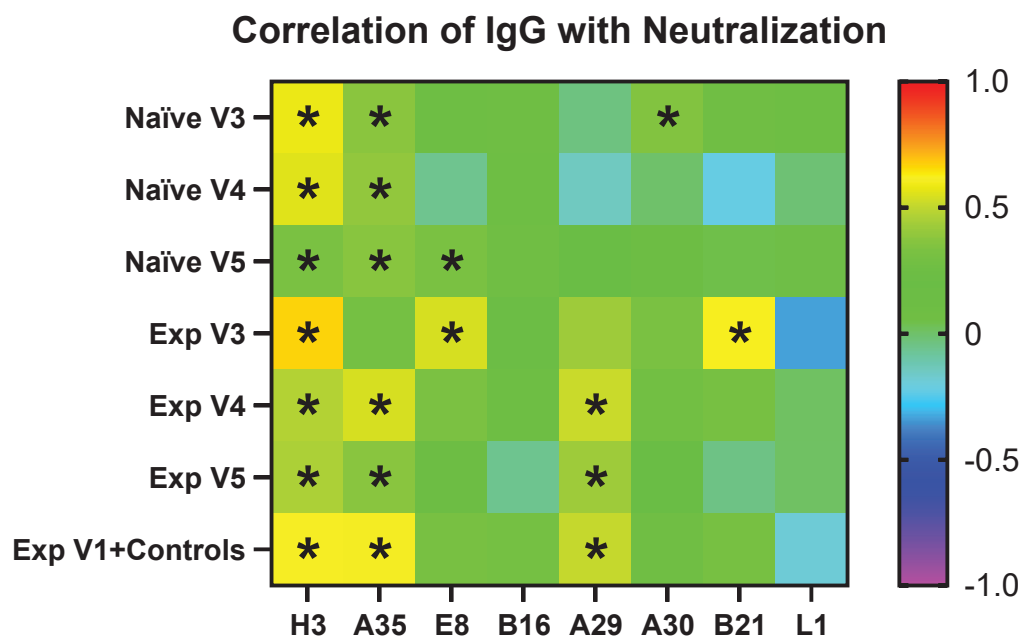

Figure S7: MPXV H3 and A35 are immunodominant in all participants and significantly correlate with MPXV neutralization. A) Proportion of participants that are IgG-positive for the indicated MPXV protein at a given time point and prior smallpox vaccination status. B) Spearman correlation for each MPXV protein against neutralizing titers by time point and prior smallpox vaccination status. Significant correlations, i.e., $p < 0.05$, are denoted with an asterisk. Exp, experienced vaccinees (prior history of smallpox vaccination).
