## **Additional Methodological Information.**

### Further enrollment and follow-up from original consortium data

Following the publication of the manuscript Anger et al, 2012, the New York City Department of Health continued to expand their dataset as part of routine programmatic activities. Contact tracing and follow-up data from 2007 to 2019 were added to the New York City cohort for the purposes of this analysis. Although contact tracing was done by the same group (New York City Department of Health), exact methods throughout this time period are not exactly the same. For example, IGRAs were used in later years of the study time period.

### Event Ascertainment

Events were ascertained using several strategies selected by each cohort's investigator group. For tuberculosis diagnosis events, cohorts either diagnosed cases prospectively or used data linkage to national or sub-national tuberculosis registries. Most prospective studies used some type of microbiological test, either as a baseline evaluation or a triage test. Diagnosis of tuberculosis in all prospective studies included either a positive microbiological test or a physical examination and subsequent clinical diagnosis. Some prospective studies used diagnostic tests as part of their study procedures and also used national or sub-national tuberculosis registries.

### Systematic Search.

Case-control studies and outbreak reports were excluded, as were reviews, editorials, letters, or studies for which individual outcomes were not reported. We did not restrict articles by language and reviewed manuscripts written in English, Chinese, French, German, Japanese, Korean, Persian, Portuguese, Russian, and Turkish. To facilitate the review process, a list of 'exclusionary words' was developed, based on words in titles highly suggestive of irrelevant content (see below for complete explanation and list). Manuscripts were excluded if their titles contained any of these exclusionary words. Two reviewers independently reviewed articles in two stages: evaluation of titles and abstracts followed by full-text review. After the review of titles and abstracts, the two reviewers discussed discrepancies and re-evaluated articles until consensus was reached. During this stage, if an abstract was in a language other than English the manuscript was advanced to the full-text review stage. Relevant articles were subject to a full-text review by both reviewers and any discrepancies were again resolved by reviewer discussion and consensus. If eligibility could not be assessed from the full-text manuscript because of missing information, we contacted authors for clarification. We evaluated eligible articles for duplication of data on the same individuals and excluded manuscripts if necessary.

### Preventive Treatment

Preventive treatment was assigned to participants according to each study's protocol or local guidelines and practices.

### Study Quality.

Each study was judged based on a 9-point scale using three broad criteria: selection of participants (4 points), comparability of studies (2 points), and ascertainment of outcome of interest (3 points). High study quality was defined as >66.6%, moderate quality as 33.3-66.6%, and low quality as <33.3%. Discrepancies between the two reviewers were resolved by re-evaluating the study for consensus.

### Study-level characteristics.

Country-level tuberculosis incidence data was collected from World Health Organization databases for each study. This variable was used as a continuous variable. Studies were categorized into “high-burden” country as classified by the World Health Organization. Studies were also grouped into World Health Organization global regions and World Bank country-level economies (high- income, upper-middle-income, lower-middle-income, and low-income) as of October 2018.

## Search Strategy.

## Exclusionary Keyword Algorithm for Study Titles.

### i. Description of the Algorithm.

We wrote a script parsing titles into individual words. We selected words highly suggestive that an article was unrelated to our study objectives. Articles were then eliminated based on whether their titles contained these words.

In order to validate this process, we implemented the algorithm on the first 100 titles and manually screened them for eligibility in the study. Our exclusionary algorithm eliminated all articles that were screened out by manual screening with 100% specificity. This suggested that our selected words were appropriate. Out of the 9,243 articles disqualified at the title stage, 1,829 (19.7%) were eliminated based on whether they contained one of the exclusionary words. The code for exclusion words and article elimination, as well as the entire list of exclusionary words can be found below.

### ii. Python script:

```
"""  
Script parsing tokens for excluding titles and matching the tokens to the original word counterpart to each token.  
  
Each title is normalized to lower-case letters and numbers with no punctuation. Excluding tokens use this format.  
A list of exclusion tokens is used to eliminate all matching titles.

World Health Organization high-burden country*	2	22
Background burden, >100 incident cases per 100 thousand people	3	33
Country-level tuberculosis incidence (per 100 000 people)†		
Below 50	2	22
50–100	4	44
>100–200	2	22
Above 200	1	11
World Health Organization region		
African	1	11
Americas	3	33
Eastern Mediterranean	0	0
European	2	22
South-East Asia	1	11
Western Pacific	2	22
HIV status of participant reported	5	56
Cohort size		
Less than 1000	7	78
1000 or greater	2	22
QuantIFERON or tuberculin skin testing	7	78

Table S2. Study results with information on multi-drug resistant status of index cases.

<b>Characteristic</b>	<b>N<sub>treated</sub>/N<sub>total</sub></b>	<b>Adjusted Hazard Ratio (95% CI)</b>
All participants (Model 1)	722/4,945	0.41 (0.23-0.72)
All participants (Model 2)	722/4,945	0.32 (0.18-0.58)
All participants (Model 3)	722/4,945	0.30 (0.16-0.56)
Age group, years		
Child, <18	583/1,467	0.39 (0.18-0.87)
Adult, 18 and over	139/3,425	0.44 (0.14-1.41)
HIV status		
Positive	5/329	Undefined
Negative	610/3,271	0.29 (0.16-0.54)
Prior tuberculosis		
Yes	11/313	0.55 (0.13-2.36)
No	653/4,227	0.34 (0.16-0.69)
TST or IGRA status		
Positive	134/954	Undefined
Negative	33/664	Undefined

Model 1 includes all contacts and is adjusted for age and the study design and has a random study-level effect. Model 2 includes all contacts and is adjusted for age, sex, the study design and has a random study-level effect.

Model 3 includes contacts and is adjusted for age, sex, prior tuberculosis, the study design and has a random study-level effect.

Table S3. Effectiveness of isoniazid preventive treatment against incident tuberculosis among contacts exposed to MDR tuberculosis, by time period of follow-up.

	<b>N<sub>events</sub></b>	<b>Person-years</b>	<b>aHR</b>	<b>95% CI</b>
Time period				
<365 days	70	4,712	0.07	0.02-0.52
365 to 729 days	35	3,561	0.20	0.05-0.89
730 days and after	48	2,749	0.74	0.34-1.59

---

aHR: adjusted hazard ratio

Table S4. Incidence rate ratios among subgroups of children exposed to multidrug-resistant tuberculosis, stratified by the age of the child.

	<b>Incidence rate ratios</b>	<b>95% confidence interval</b>
Age, years		
0 to 4	Undefined**	
5 to 9	1.93	0.39-9.59
10 to 19	0.44	0.18-1.05

---

\*\* 0 events occurred among 176 children in this category that took isoniazid TPT. Among 247 children in this category that did not take TPT, five (2%) developed incident tuberculosis. Due to no events in the isoniazid TPT group, a measure of association was not able to be calculated.

Table S5. Incidence rate ratios among subgroups of participants exposed to multidrug-resistant tuberculosis, stratified by the background tuberculosis incidence of the country.

	Given INH TPT		Not given TPT		Risk difference (95% CI)
	N <sub>participants</sub>	N <sub>events</sub>	N <sub>participants</sub>	N <sub>events</sub>	
Background incidence (per 100K persons)					
<50	135	0	854	10	1.1 (0.4, 1.9), P <sub>exact</sub> =0.61
50 to 100	36	0	729	1	0.1 (-0.1, 0.4), P <sub>exact</sub> =1.00
>100	591	13	2,595	127	2.7 (1.2-4.1), P=0.0047

---

Table S6. Assessment of Quality of the Included Studies.

We assessed the quality of each study based on a modified version of Newcastle-Ottawa scale (Wells, 2012)<sup>†</sup>. We assessed each study's selection process, comparability, and outcome for a maximum total of 9 points. Studies were ranked high if they had a score of greater than 66.6%, moderate if they had a score greater than 33.3 and less than or equal to 66.6%, and low if they had a score of less than or equal to 33.3%.

Study <sup>†</sup>	Selection			Comparability	Outcome			Rating		Quality
	Representativeness of sample <sup>a</sup>	Ascertainment of exposure status - How was index case diagnosed? <sup>b</sup>	Demonstration that TB in contacts was not present at baseline. <sup>c</sup>		Comparability of cohorts (2 points) <sup>d</sup>	Assessment of tuberculosis (2 points) <sup>e</sup>	Was follow up long enough for outcomes to occur? <sup>f</sup>	Adequacy of follow up of exposed contacts <sup>g</sup>	Rating	
Grandjean, 2010	A*	A*	C	B*/C	A*/C	A*	E	5	0.56	moderate
Grandjean, 2015	C	A*	A*	A*/B*	A*/B*	A*	E	7	0.78	high
Chan, 2014	A*	A*	A*	B*/C	A*/B*	A*	E	7	0.78	high
Chakhaia, 2014	C	A*	A*	C/D	A*/B*	A*	E	5	0.56	moderate
Altet, 2015	A*	A*	A*	A*/B*	A*/B*	A*	B*	9	1.00	high
Mazahir, 2017	A*	A*	A*	A*/D	A*/B*	A*	A*	8	0.89	high
Lu, 2015	B*	A*	B*	B*	D	A*	C*	6	0.67	moderate

Anger, 2012	B*	A*	A*	C/B*	B*	A*	C*	7	0.78	high
Gounder, 2015	A*	A*	A*	C/B*	B*	A*	C*	7	0.78	high

†Hannoun, 2016 was a conference abstract and therefore was not included in the assessment.

<sup>a</sup> A\*- Representative of the average TB case/TB contact in the community; B\*- Somewhat representative of the average TB case/TB contact in the community; C - Selected group of TB cases/TB contacts, chance of bias; D - No description of the derivation of the cohort;

<sup>b</sup> A\*- Microbiological (smear, culture, Xpert) testing of TB cases was done for all tuberculosis index cases; B - Chest radiographical/clinical diagnosis of tuberculosis index cases without microbiological testing; C - No description of the derivation of the cohort;

<sup>c</sup> A\*- Reported testing for and numbers of tuberculosis cases in children at baseline; B\*- Reported prevalent tuberculosis as an exclusion criteria for incident tuberculosis; C - No demonstration of lack of tuberculosis disease at baseline visit

<sup>d</sup> A\*- Prospective Cohort; B\* - Adjusted odds ratio; C - Retrospective Cohort; D - Adjusted Odd Ratio not specified; E - nothing specified;

<sup>e</sup> A\*- Microbiological testing; B\* - Radiographical and clinical (must have both); C - Radiographical or clinical (only 1); D - No description;

<sup>f</sup> A\* - Yes (at least 3 months) after exposure to infectious patient with mycobacterium tuberculosis\*; B - No; C - Information not provided;

<sup>g</sup> A\* - If prospective, all children exposed were evaluated for tuberculosis during follow-up; B\* - If prospective,  $\leq 10\%$  of children exposed lost to follow up; C\* - If retrospective, number of children lost to follow-up or excluded is reported and  $\leq 10\%$ ; D - If retrospective or prospective, greater than 10% lost to follow up; E - If prospective or retrospective, number of children lost to follow up not reported.

Table S7. Demographic characteristics of participants administered and not administered preventive treatment.

Characteristic	Not administered INH preventive treatment	Administered INH preventive treatment
	n, %	n, %
Total individuals evaluated for incidence	4,134	722
Total person-years follow-up	10,375	1,663
Median follow-up time (IQR)	2.3 (1.4-4)	2.1 (1.4-3.3)
Age group, years		
<10	515 (13)	326 (45)
10-19	493 (12)	291 (40)
20-29	794 (19)	36 (5)
30 and over	2,294 (56)	69 (10)
Sex		
Male	1,907 (47)	339 (49)
Female	2,170 (53)	354 (51)
QuantiFERON or tuberculin skin tested	1,381 (33)	169 (23)

---

Figure S1. Map of Location of Included Studies.

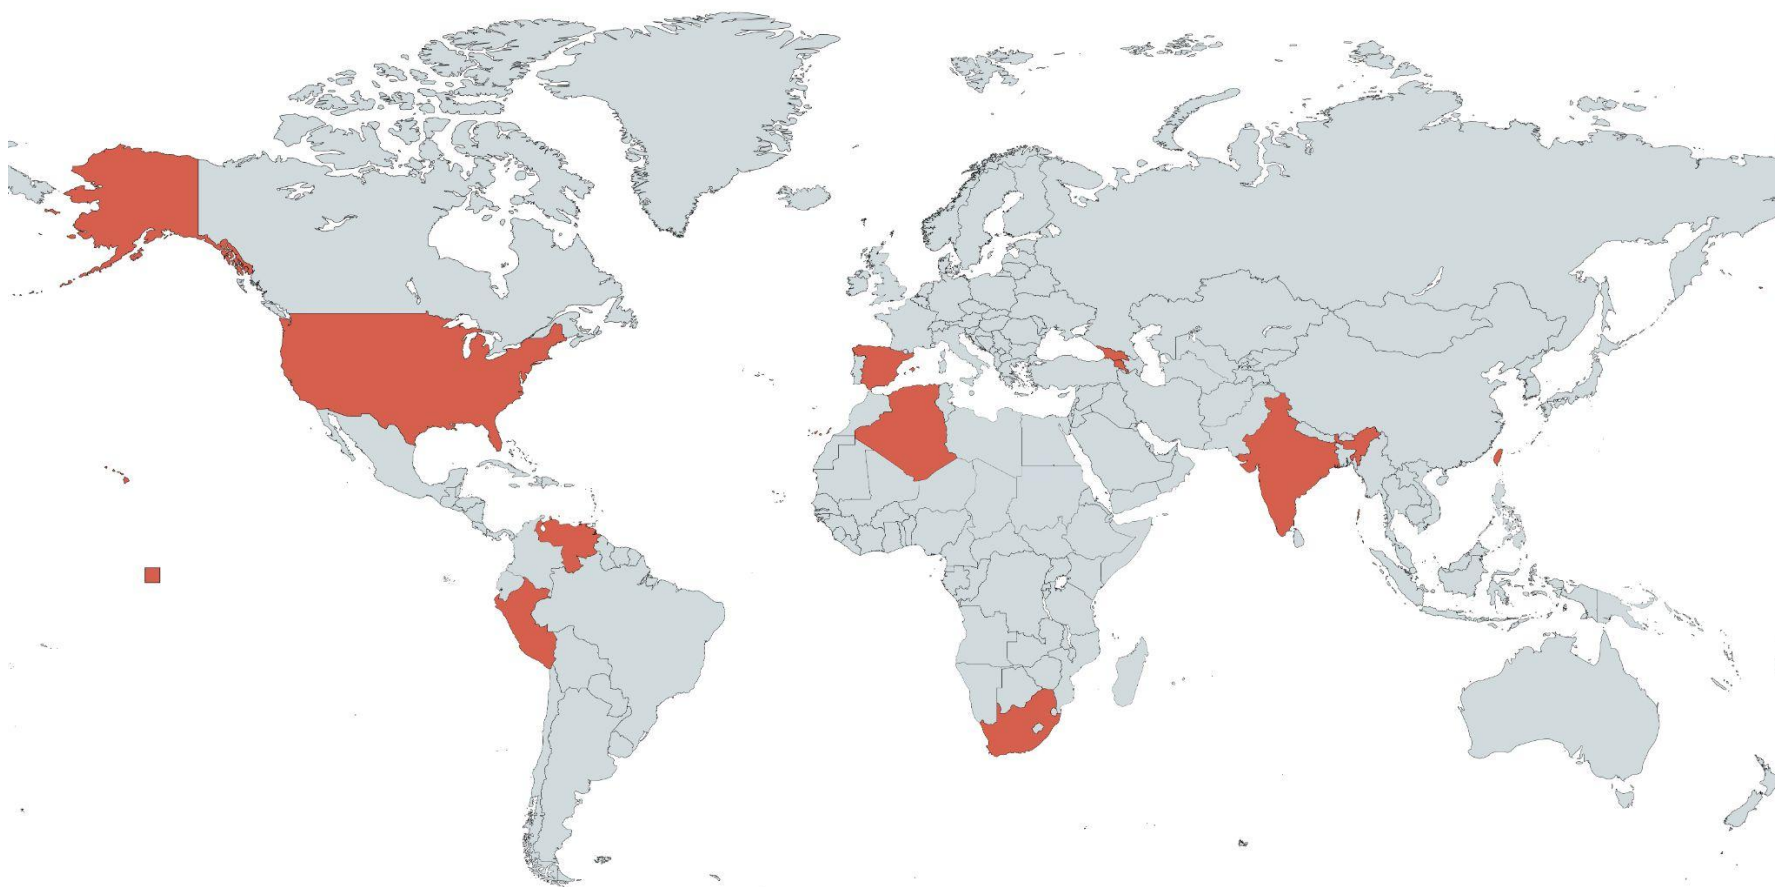

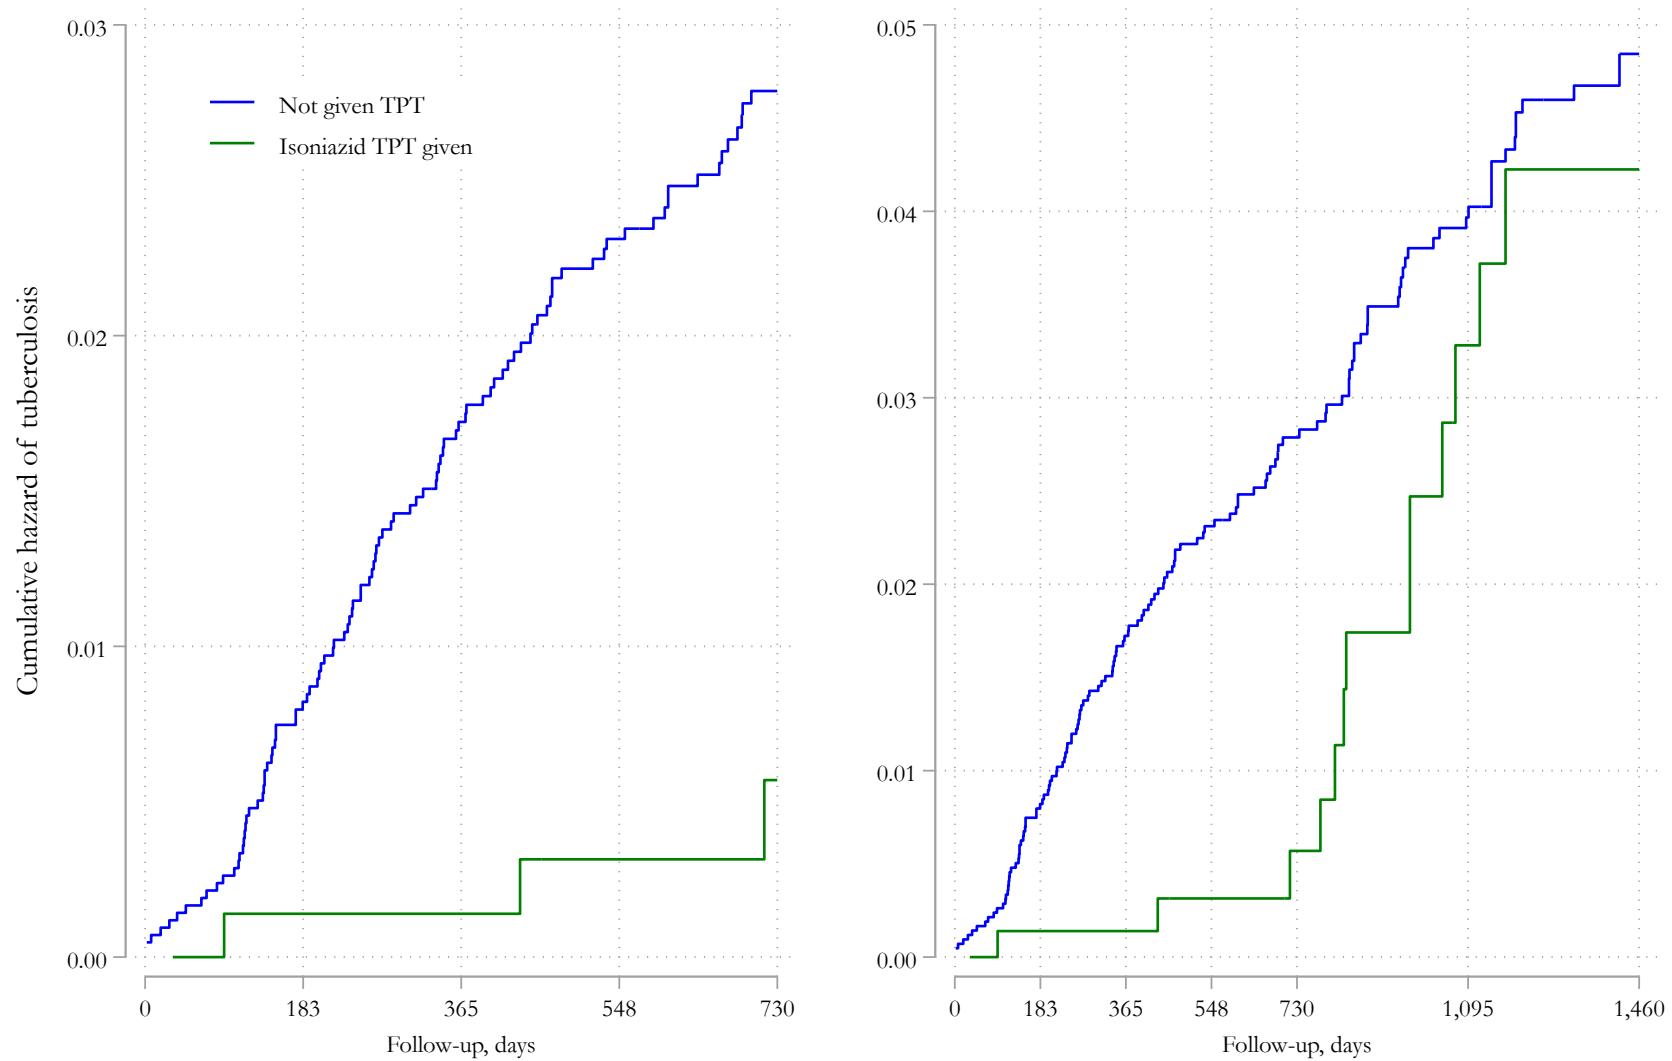

Figure S2. Two- and four-year follow-up for tuberculosis, stratified by isoniazid TPT given

†This graph is a Kaplan Meier curve, unadjusted for study-level random effects. Therefore, as you go along the X-axis and follow-up, there are fewer and fewer patients included. This could lead to other biases, especially after 2 years of follow-up.
