

**1** Generate, integrate, and cluster VAT and SAT gene expression at the cell-type level in the KOBIS cohort

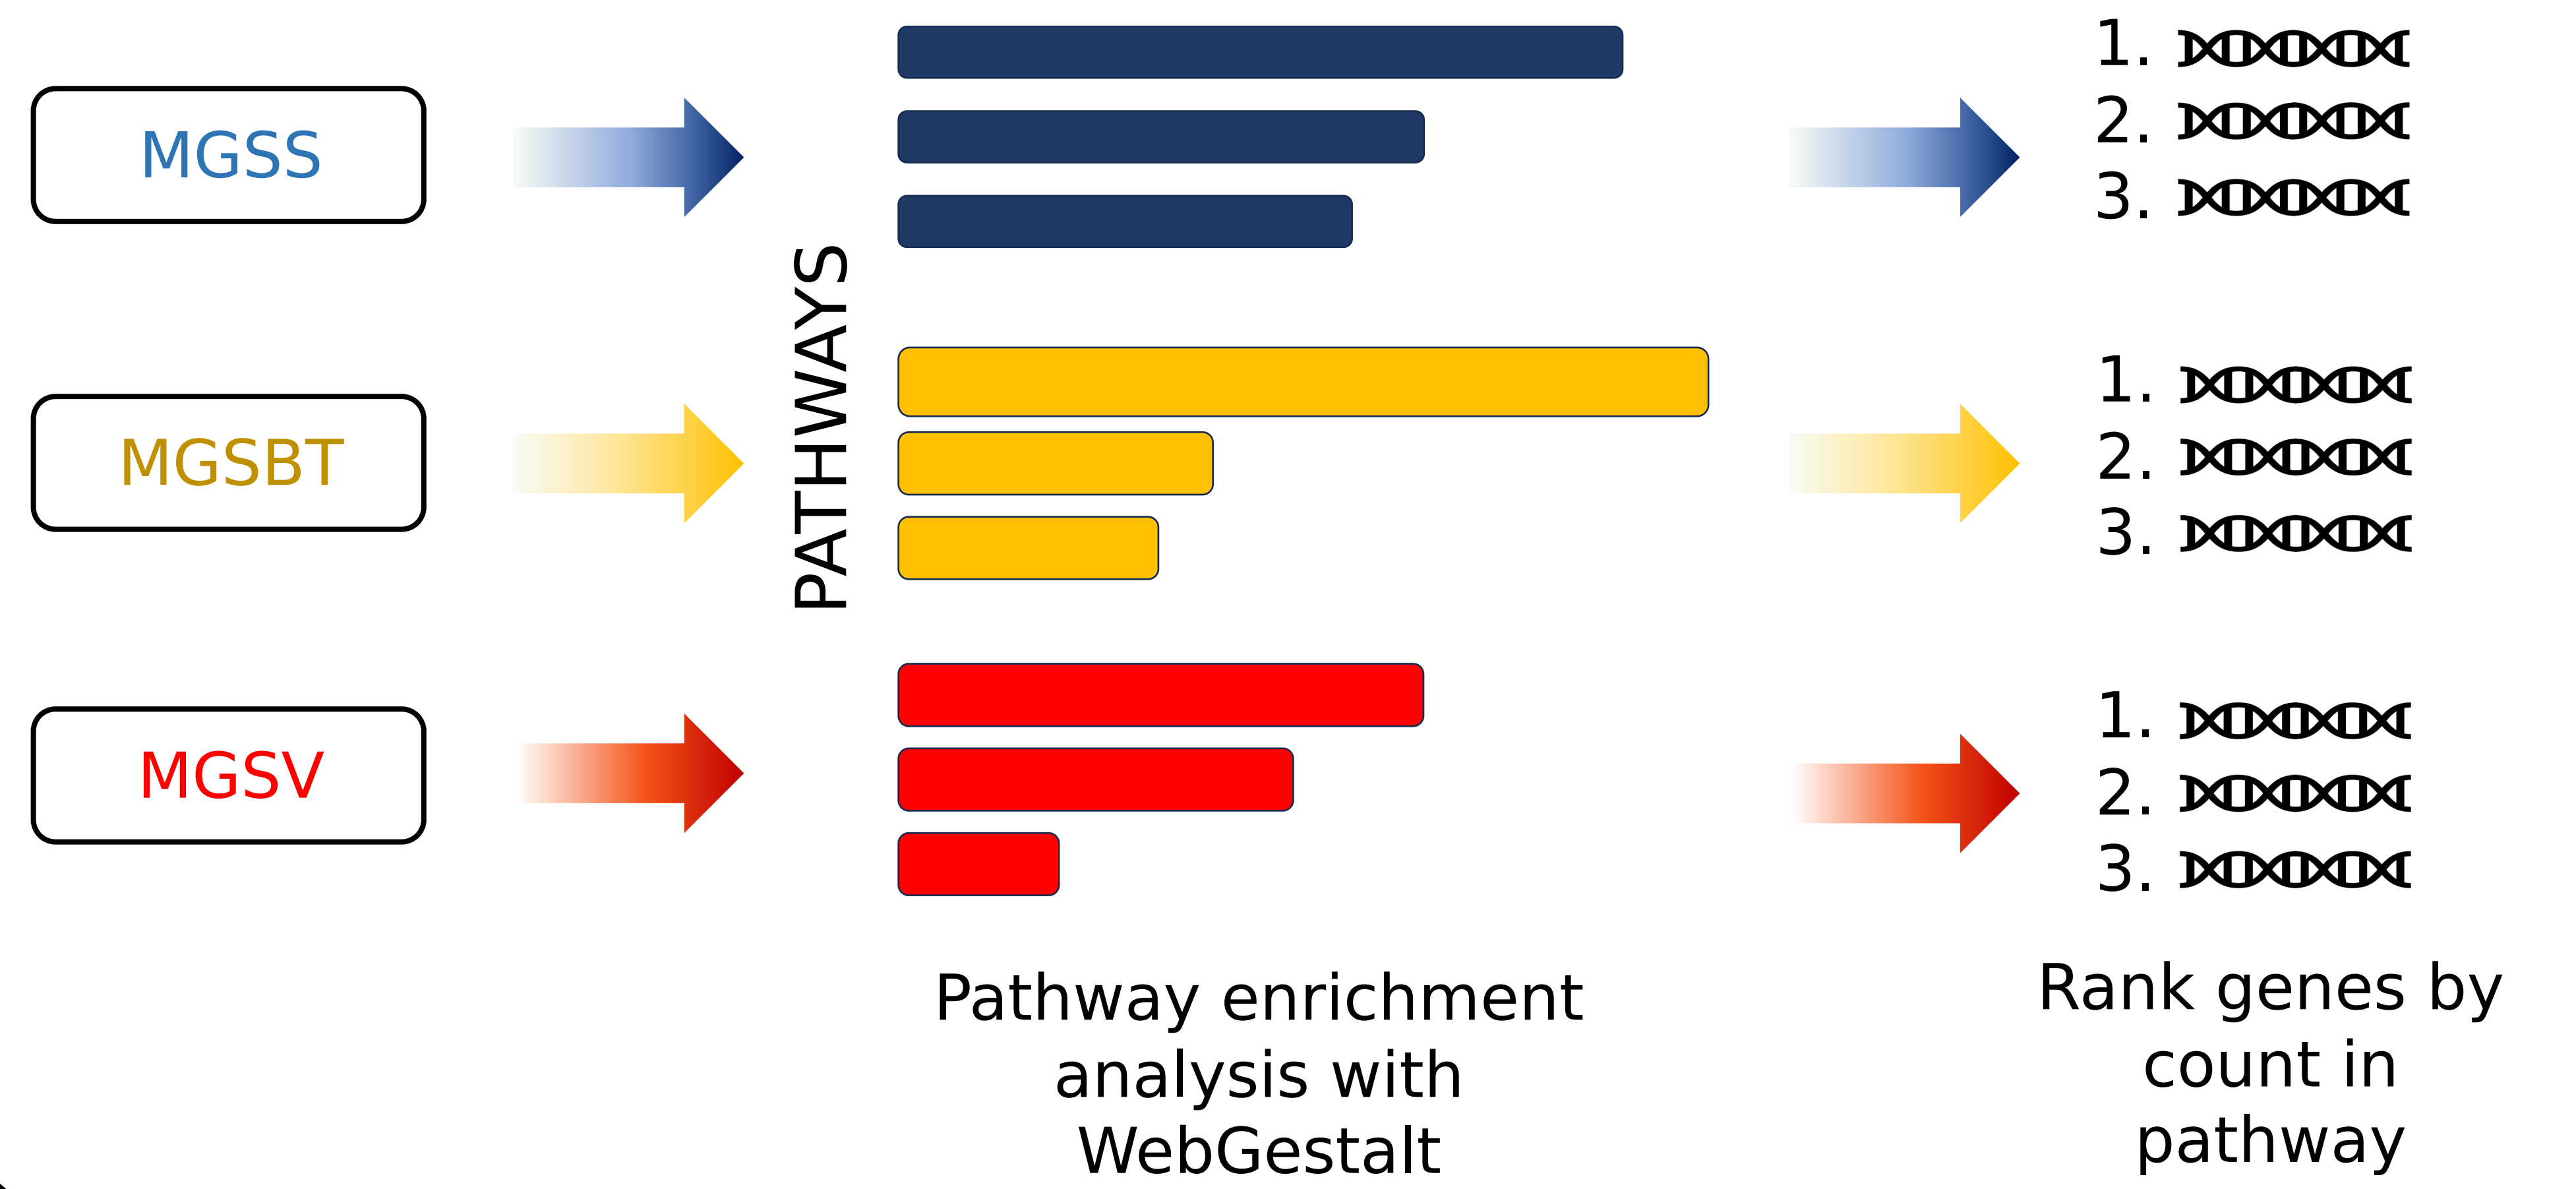

**2** Identification of marker genes specific to SAT (MGSS), VAT (MGSV), and shared between the tissues (MGSBT)

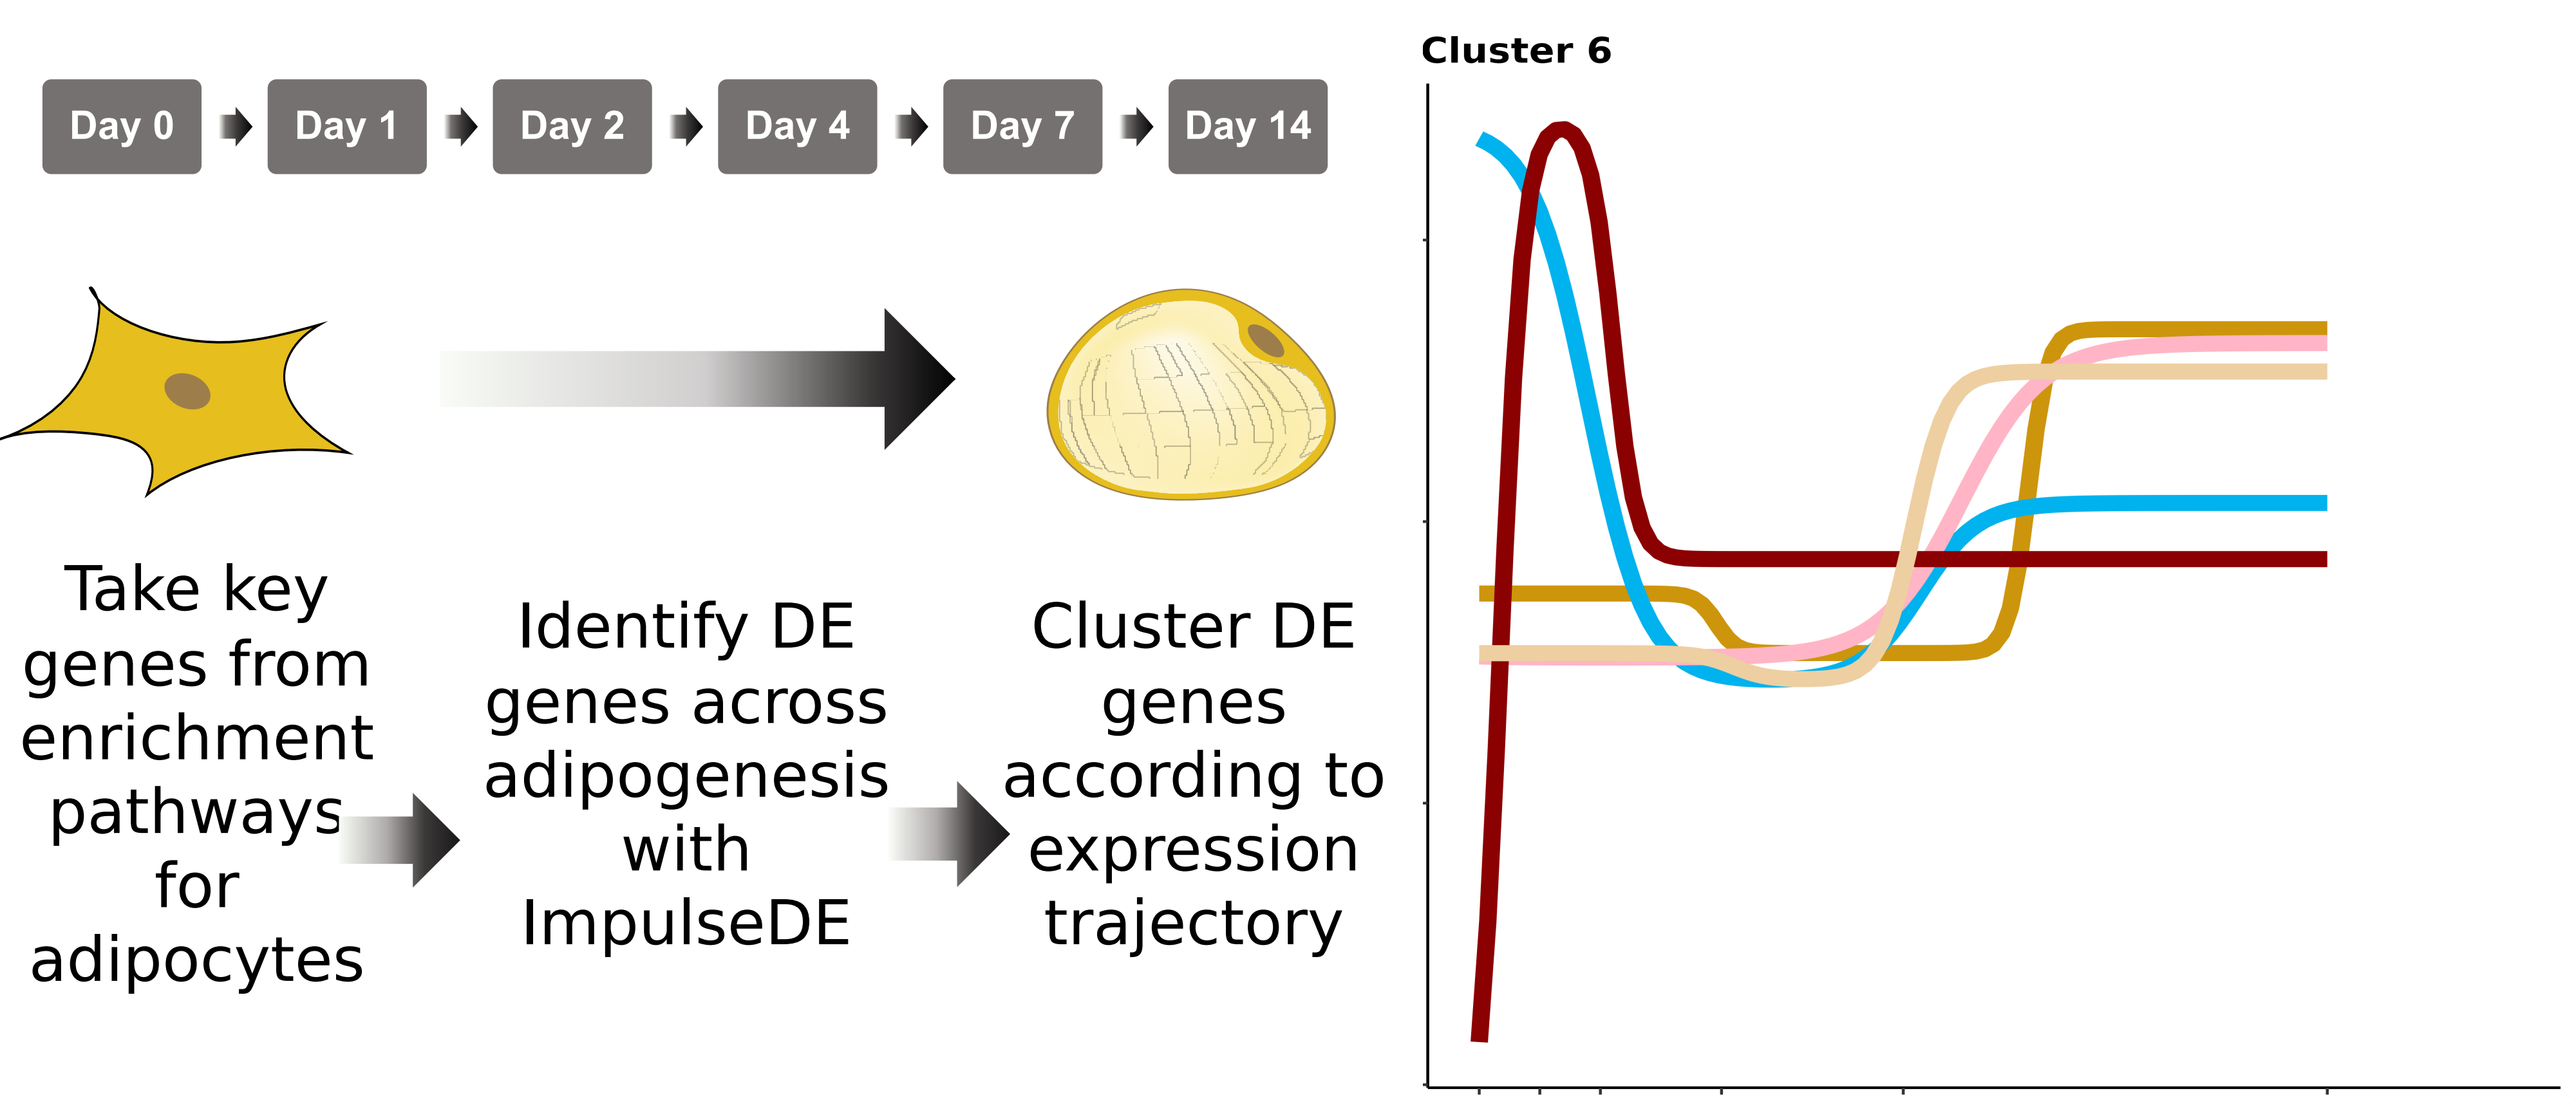

**3** Determine variance explained of abdominal obesity using regional PRSs of marker genes

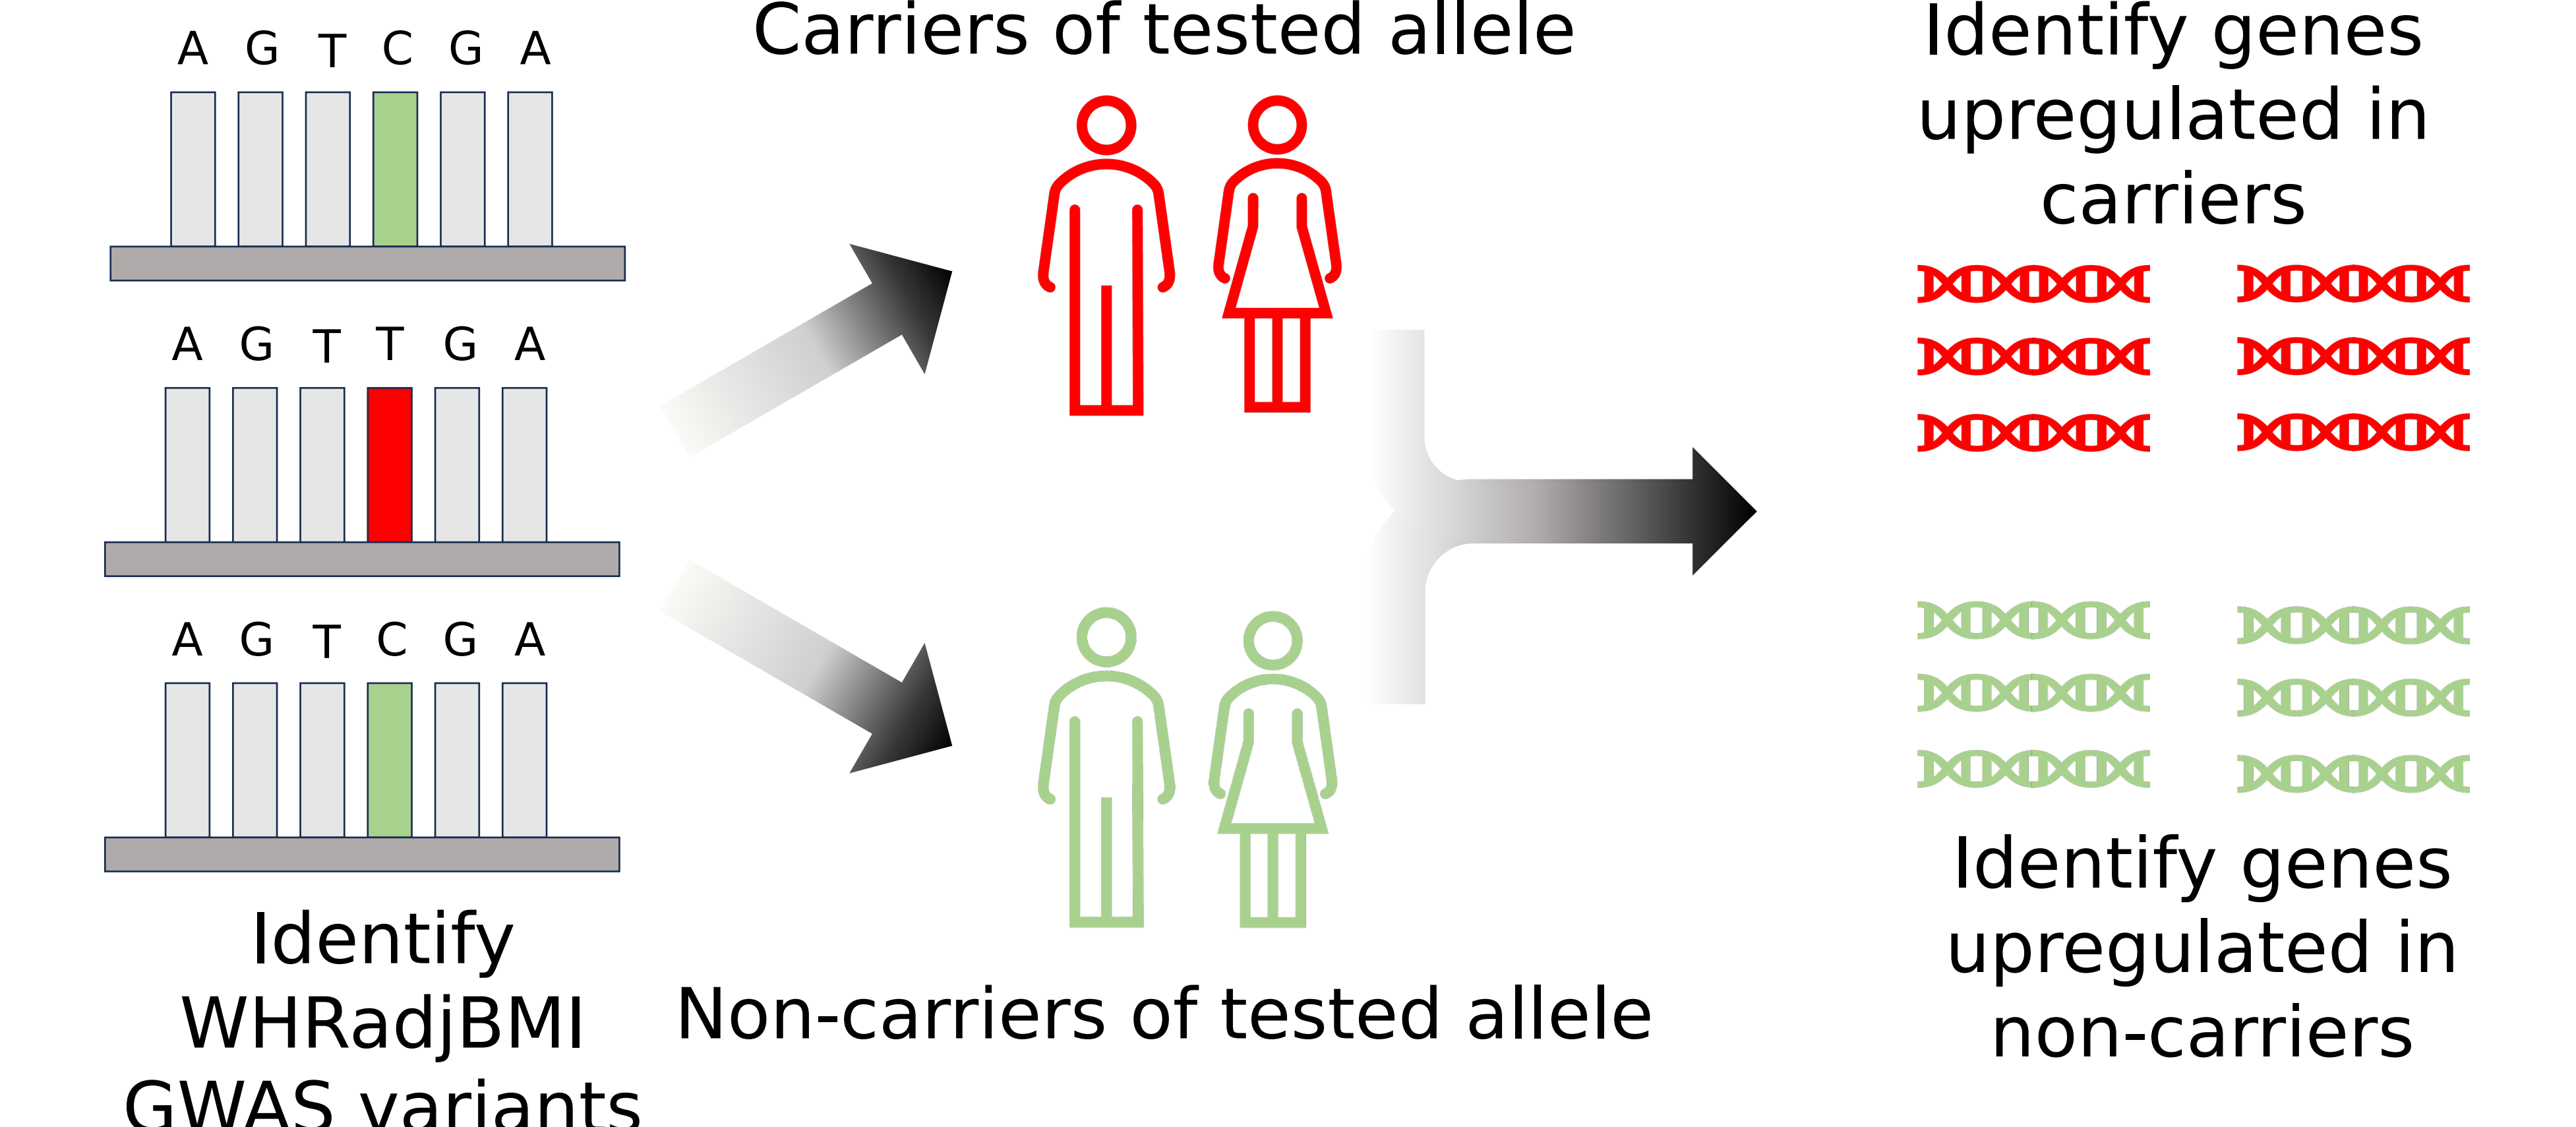

**4** Identification of functional cell-type and tissue-specific marker genes through pathway enrichment

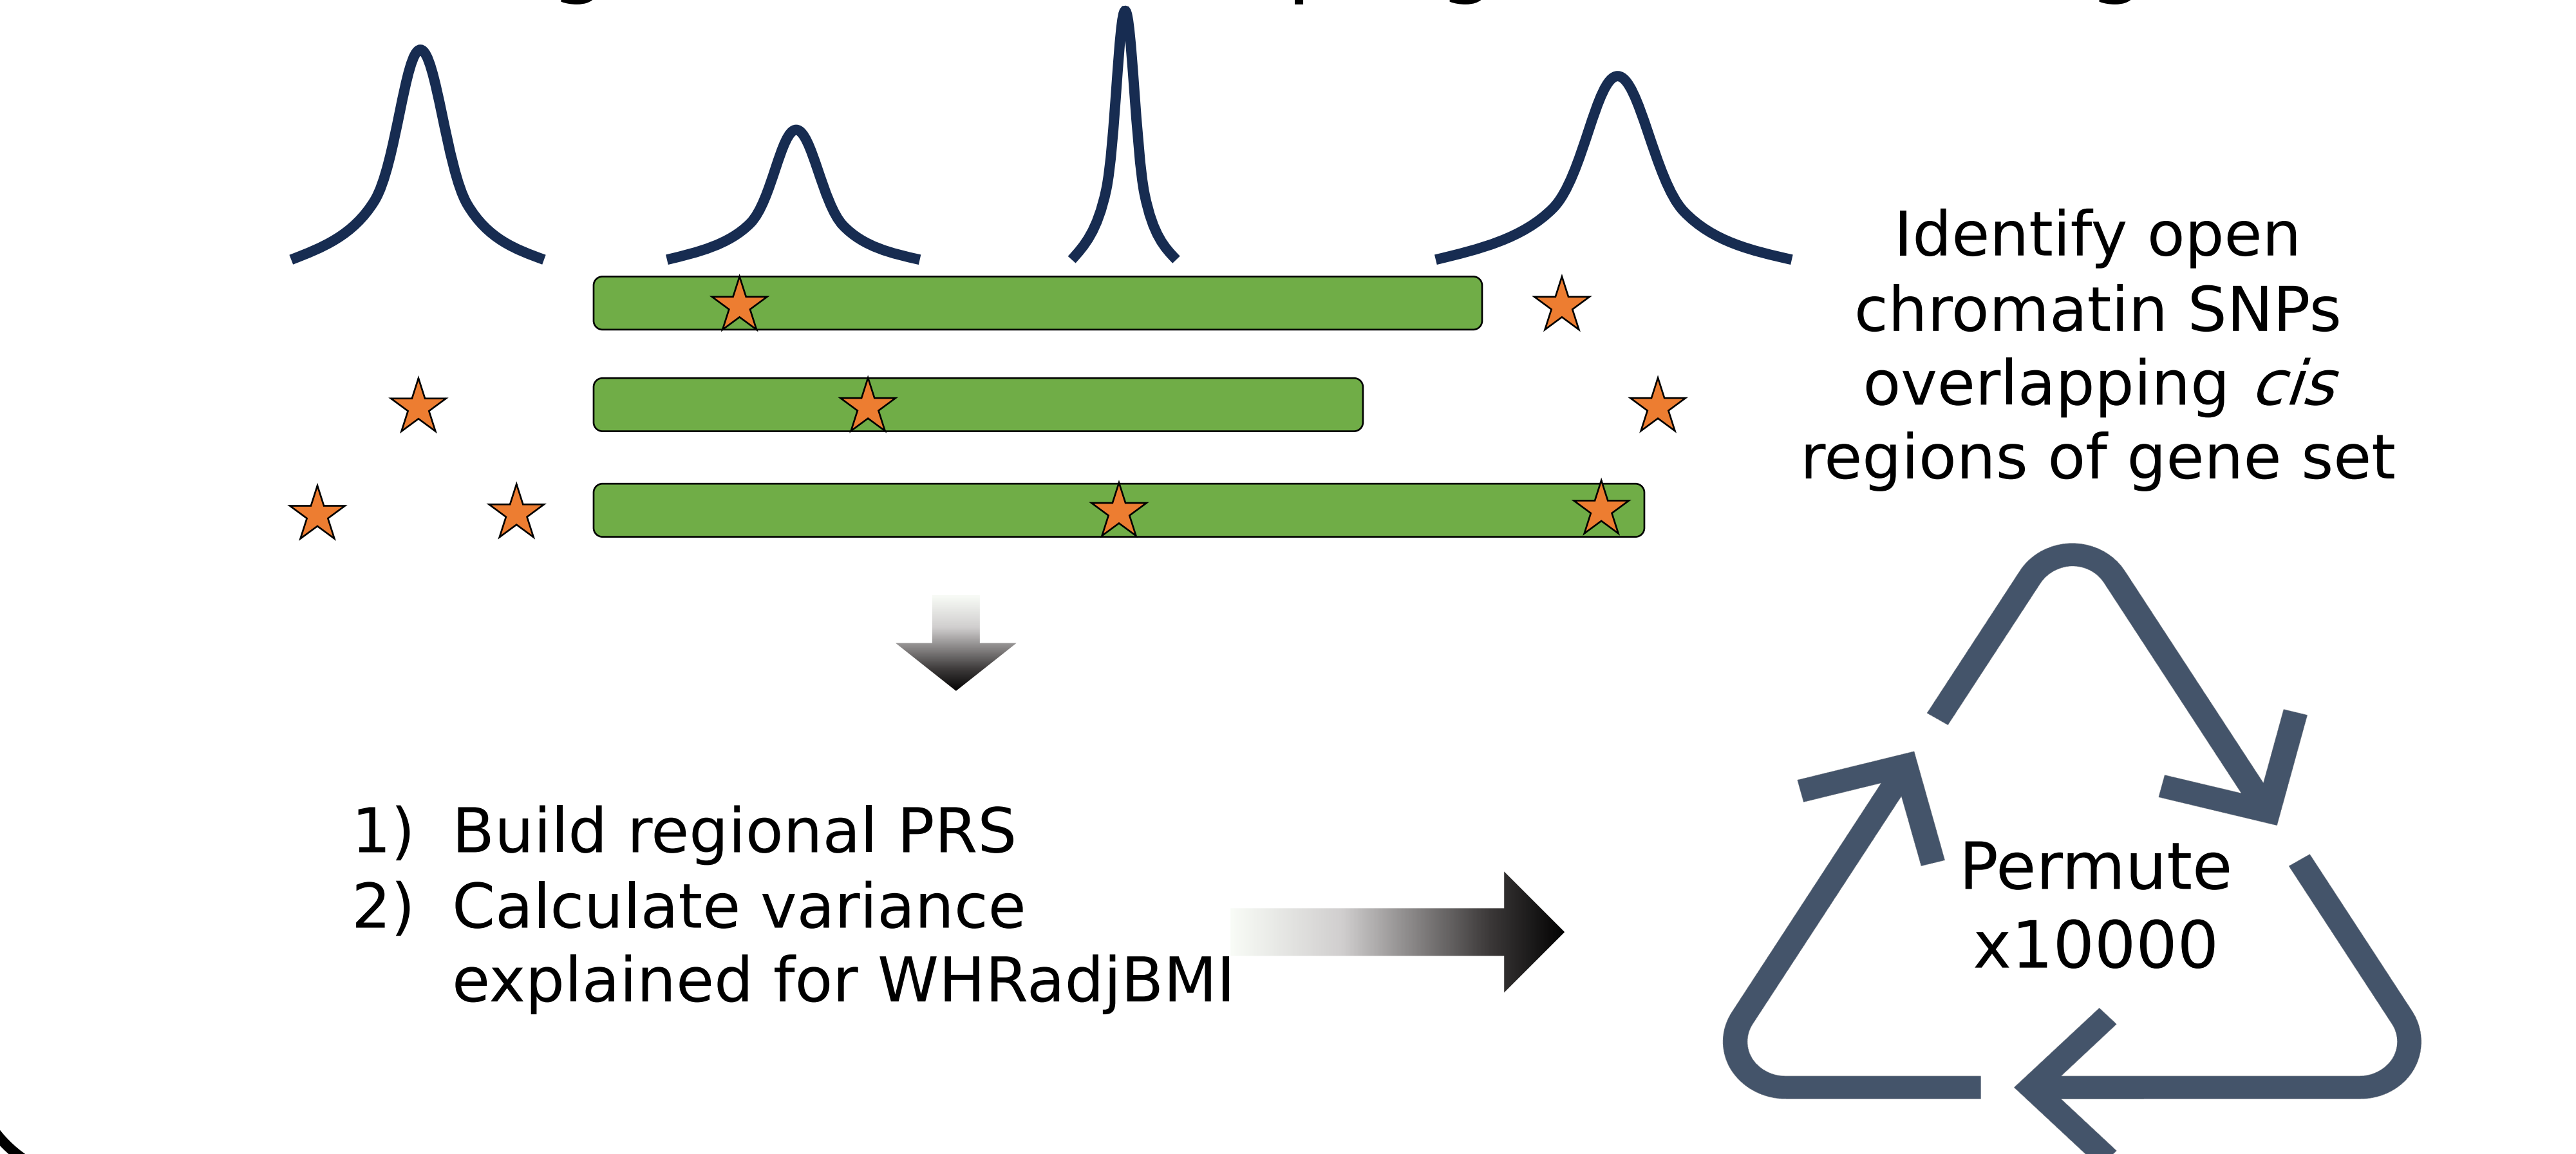

**5** Analysis of longitudinal differential expression and temporal co-expression across 6 time points of adipogenesis

**6** Identification of SAT adipocyte marker genes down/upregulated by the risk allele carrier status of the WHRadjBMI GWAS SNPs

**7** Determine variance explained of abdominal obesity using PRSs of open chromatin SNPs in *cis* regions of down/upregulated *trans* genes

**8** Identify differences in individual level PRS scores between risk allele carrier status
