

1 **SUPPLEMENTARY MATERIALS FOR:**

2
3 **Efficacy of Melflufen in Patients with Relapsed/Refractory Multiple Myeloma and**
4 **Mutated or Deleted *TP53***

5 **SUPPLEMENTARY MATERIALS AND METHODS**

6
7 **Patient samples**

8 Bone marrow (BM) aspirates (n=24) were collected from 23 multiple myeloma (MM) patients
9 after informed consent using protocols approved by an ethical committee and in accordance
10 with the Declaration of Helsinki. BM mononuclear cells (BM-MNCs) were purified by Ficoll
11 gradient centrifugation and cryopreserved prior to analyses.

12
13 **Ex vivo drug sensitivity testing with patient cells by flow cytometry**

14 For flow cytometry (FC)-based drug sensitivity testing, viably frozen MM patient BM-MNC were
15 thawed, freezing solution washed away, cell pellet suspended in conditioned medium (RPMI
16 1640 medium supplemented with 10% FBS, 2 mM L-glutamine, penicillin (100 U/ml),
17 streptomycin (100 µg/ml) and 25% conditioned medium from the HS-5 human bone marrow
18 stromal cell line),¹ DNase I (Promega) treated for 60 min, and cultured in conditioned medium
19 overnight. Cells were filtered through a 70 µm cell strainer (Fisher Scientific), cell viability
20 measured and cells plated in parallel on pre-drugged 96-well plates (100,000 viable cells/well
21 in 100 µl). If cell viability was poor (<50%), the Dead Cell Removal kit (Miltenyi Biotec) was
22 used prior to plating the cells. Stock solutions (10 000 µM) of melflufen (Oncopeptides AB)
23 and melphalan (Sigma-Aldrich), that had been prepared in advance and stored at -80 °C, were
24 thawed and diluted in conditioned medium to desired concentrations shortly before the drug
25 testing to minimize auto-hydrolysis of melflufen and melphalan (exchange of Cl with OH at the
26 *N*-mustard part of the molecules). Melflufen and melphalan were added to the 96-well plates
27 by manually pipetting only after the cells had been plated, just prior to the start of the drug
28 sensitivity test. The cells were incubated with the drugs for 72 h at 37 °C and 5% CO₂.

29 Following 72 h incubation with the drugs, cells were centrifuged (500xg, 6 min) in the 96-well
30 plates and media discarded by inverting the plate. Cells were suspended in 25 µl of antibody
31 mix containing staining buffer (5% FBS in Dulbecco's phosphate-buffered saline) and the
32 following two antibodies (BD Biosciences): CD138 (BV605, clone MI15, dilution 1:100) and
33 CD38 (BV786, clone HIT2, 1:100). Cells were stained for 30 min at room temperature in the
34 dark and subsequently washed with 100 µl staining buffer followed by centrifugation (500xg,
35 6 min) and supernatant removal by inverting the plate. Apoptotic and dead cells were
36 discriminated by 7-aminoactinomycin D (7-AAD) and PE-Annexin V (BD Biosciences) staining
37 with both dyes diluted 1:50 in 25 µl annexin V binding buffer. The plates were incubated for
38 10 min at room temperature before FC analysis. FC analysis was performed using the
39 IntelliCyt iQue Screener PLUS instrument (Sartorius). MM patient sample BM-MNCs were
40 acquired for analysis from each 96-well plate well by the iQue Screener PLUS instrument
41 using a 17 s sip time per well and a pump speed of 32 revolutions per minute. ForeCyt software
42 (Sartorius) was used to gate cells and acquire population counts. Analysis was done from
43 viable singlet cells. The cell count of a well was normalized to its 6 adjacent DMSO controls,
44 from which the highest and lowest value were excluded and normalized values were used for
45 calculating cell viability percentages for each tested drug concentration, and dose response
46 curves drawn. Drug sensitivity score (DSS) values were calculated based on the dose-
47 response curves.²

48

49 **Single-cell gene expression analysis**

50 For single cell RNA sequence (scRNAseq) analysis, the MM patient BM-MNCs were sorted
51 based on cell viability (7-AAD, BD Biosciences) and CD138⁺ surface expression (APC, clone
52 MI15, BD Biosciences) using fluorescence-activated cell sorting (BD Influx Cell Sorter, BD
53 Biosciences). CD138⁺ and CD138⁻ sorted cell fractions were mixed at a 1:1 ratio with a
54 maximum of 800,000 cells per sample. If there were fewer than 400,000 CD138⁺ cells, then
55 all CD138⁺ cells were mixed with 400,000 CD138⁻ cells. scRNAseq library preparation was
56 performed on the mixed CD138⁺ and CD138⁺ cell samples using the Chromium Single Cell

57 3' Gene Expression v3 reagent kit (10x Genomics). The gel beads in emulsion (GEM)
58 generation, cDNA amplification and library preparation were performed according to the
59 manufacturer's instructions. The prepared libraries were then sequenced on the Illumina
60 NovaSeq 6000 instrument (Illumina) with paired-end reads 28 bp and 89 bp.

61 Analysis of scRNA-seq data was performed in R Studio environment, using Seurat
62 package (version 4.0.1).³ Upon data uploading, quality control of cells was done. We used
63 percentage of mitochondrial genes (< triple median or 30%, whichever is less), number of
64 unique genes (>500), number of transcripts (< triple median), and log₁₀ transformed ratio of
65 number of transcripts to number of unique genes (>0.8) to remove dead and late apoptotic
66 cells, as well as multiplets from the subsequent analysis. Samples were integrated, using
67 anchoring procedure, normalized and variance stabilized, and clustered, based on
68 construction of a Shared Nearest Neighbour Graph, which utilized dataset with dimensions
69 reduced by the prior principal component analysis. Clusters were identified, based on the gene
70 expression patterns, and divided into plasma cells (CD138+ pre-sorted fraction) and cells of
71 other types (CD138- pre-sorted fraction) for further analysis. After the division of the initial
72 dataset, new ones were re-integrated, normalized, and clustered. Additionally, for plasma cells
73 dataset, we filtered out immunoglobulin genes. Final clustering results were checked for the
74 distribution of cells, based on cell cycle phase and mitochondrial content, and annotated, using
75 the genes expressed differently between the given and all the other clusters.

76 For the analysis of differentially expressed genes (DGE), we sequentially compared
77 HS vs IS, IS vs LS, and HS vs LS samples, filtering out non-monotonous changes in gene
78 expression between those groups, and using the threshold of 0.2 for log₂-transformed fold
79 change values. The identification of DGE was done by the means of MAST framework.⁴

80 For the gene set enrichment analysis, clusterProfiler (v.3.18.1)⁵ and ReactomePA (v.
81 1.34.0)⁶ packages were used. We utilized Reactome⁷, KEGG⁸ and MSigDB^{9,10} datasets.
82 Differentially expressed genes from melflufen comparison, with preliminary subtracted genes
83 from DGE analysis for melphalan, and retained genes altered due to the disease stage, were

84 used as an input to cluster genes, based on their belonging to the gene sets, respectively to
85 their functions, regulation, or expression patterns.

86

87 **Cell lines, cell culture and cytotoxicity**

88 The AMO-1 cell line was obtained from DSMZ (Braunschweig, Germany). Generation and
89 characterization of *TP53* deficient AMO-1 clones is described in Munawar et al., 2019.¹¹

90 Standard cell culture was performed in RPMI-1640 medium supplemented with 10% fetal
91 bovine serum (FBS), 1 mM sodium pyruvate, 2 mM glutamine, 100 U/ml penicillin, and 100
92 µg/ml streptomycin. Cells were kept at 5% CO₂ and 37 °C. Cells were cultured on 96well plates
93 in 200 µl culture medium for 72 h exposure period before measuring the number of viable
94 cells. Cell viability was determined using the AlamarBlue™ reagent (Invitrogen) or cell death
95 assays (annexin V/propidiumiodide) according to the manufacturers' protocols.

96

97 **Compounds and stock solutions**

98 Melflufen (Oncopeptides AB) was freshly prepared in DMSO before application. Melphalan
99 (Sigma-Aldrich, M2011) stock solution was prepared in acidified ethanol. Cyclophosphamide
100 (N,N-bis(2-chloroethyl)-4-hydroperoxy-2-oxo-1,3,25-oxazaphosphinan-2-amine,TRC
101 (product number TRC-H714675) was freshly prepared in DMSO.

102

103 **RNA preparation and RNA-seq analysis**

104 AMO1 *TP53* wild type cells or the *TP53*^{-/-} knock out clonal subline AMO-1 *TP53*^{-/-} were treated
105 with melphalan or melflufen at different concentrations and timepoints. RNA was isolated
106 according to the RNeasy plus protocol, quantified with Nanodrop (Thermo Scientific), and
107 quality assessed with the Agilent 2100 Bioanalyzer. DNA libraries were prepared using the
108 TruSeq Stranded mRNA Library Preparation Kit (Illumina) and sequencing performed on the
109 NextSeq 500 platform (Illumina). Base calling was performed by Real-Time Analysis (RTA)
110 version 2.4.11 or 2.11.3 and demultiplexed FASTQ files were generated with bcl2fastq2

111 v2.20.0.422 (Illumina). To assure high sequence quality, Illumina reads were quality- and adapter-
112 trimmed via Cutadapt^{12,13} version 2.5 using a cutoff Phred score of 20 in NextSeq mode and reads
113 without any remaining bases were discarded (command line parameters: --nextseq-trim=20 -m 1
114 -a AGATCGGAAGAGCACACGTCTGAACTCCAGTCAC). Processed reads were subsequently
115 mapped to the human genome (GRCh38.p14) using STAR v2.7.2b with default parameters based
116 on RefSeq annotation version 110 for GRCh38.p14.¹⁴ Read counts on exon level summarized for
117 each gene were generated using featureCounts v1.6.4 from the Subread package.¹⁵ Multi-
118 mapping and multi-overlapping reads were counted strand-specific and reversely stranded with a
119 fractional count for each alignment and overlapping feature (command line parameters: -s 2 -t exon
120 -M -O --fraction). The count output was utilized to identify differentially expressed genes using
121 DESeq2¹⁵ version 1.24.0. Read counts were normalized by DESeq2 and fold-change shrinkage
122 was applied by setting the parameter "betaPrior=TRUE". Differential expression of genes was
123 assumed at an adjusted p-value (padj) after Benjamini-Hochberg correction < 0.05 and
124 $|\log_2\text{FoldChange}| \geq 0.5$. clusterProfiler version 3.12.0 was used to perform functional enrichment
125 analyses based on Kyoto Encyclopedia of Genes and Genomes (KEGG) pathways and Gene
126 Ontology (GO) terms.⁵ The *enricher* function was used to perform hypergeometric tests based on
127 lists of significant genes and the *GSEA* function was applied for gene set enrichment analysis
128 considering the DESeq2 log2FoldChange of all analyzed genes. R was applied to generate
129 heatmaps.

130

131 **DNA damage signaling and cell apoptosis analyses**

132 AMO-1 *TP53* wild type and AMO-1 *TP53*^{-/-} cells were treated with melflufen, melphalan or
133 cyclophosphamide at the indicated concentrations and time points. H2AX phosphorylation at
134 Ser139 (γ -H2AX) for DNA damage signal was analyzed using flow cytometry. The following
135 protocol was applied for *γ -H2AX staining*; Cells were fixed in Flow Cytometry Fixation Buffer
136 (R&D Systems) and stored in 70% ethanol at -20°C overnight. Prior to incubation with Alexa
137 Fluor 488-conjugated phosphorylated H2AX antibody (Sigma-Aldrich) or Mouse IgG1 (R&D
138 Systems), cells were blocked with Human Seroblock (Bio-Rad Laboratories).

139 For apoptosis analysis cells were stained for annexin V-APC and PI (Invitrogen) as follows;
140 cells were suspended in staining mix containing Annexin V APC (Invitrogen) and PI
141 (Invitrogen), fixed in Flow Cytometry Fixation Buffer and resuspended in annexin V binding
142 buffer (Invitrogen).

143 All samples were analyzed with the FACSCanto II flow cytometer (BD Biosciences). Data
144 were analyzed using FlowJo software (BD Biosciences).

145

146 **JC-1 mitochondria membrane potential assay**

147 AMO-1 *TP53* wild type and AMO-1 *TP53*^{-/-} cells at 1x10⁵/mL were treated with melflufen,
148 melphalan or cyclophosphamide at the indicated concentrations and cells were harvested
149 after 2h or 4h. The JC-1 mitochondrial membrane potential assay was performed according
150 to the manufacturers protocol (MitoProbe™ JC-1 Assay Kit for Flow Cytometry (M34152),
151 Molecular Probes, Eugene, OR). Following drug treatment, the cells were stained with JC-1
152 (5,5',6,6'-tetrachloro-1,1',3,3'-tetra-ethyl-benzimidazolyl-carbocyanine iodide) reagent for 15
153 min at 37 °C, pelleted by centrifugation (4 min/250xg), washed with PBS and resuspended in
154 PBS. The ratio of green to red fluorescence was determined with a Spectra Max i3X (Molecular
155 Devices) plate reader. Data was generated with 488 nm excitation and using 529 nm and 590
156 nm emission filters. Obtained measurement data was analyzed to calculate the mitochondria
157 membrane potential changes upon drug treatment.

158

159 **Statistical analyses of the OCEAN trial data**

160 Primary analysis of tumor response and progression-dependent endpoints of patients enrolled
161 in the OCEAN trial (NCT03151811) were based on response assessments by an Independent
162 Review Committee. All tumor response and progression-dependent endpoints were assessed
163 using the IMWG Uniform Response Criteria (IMWG-URC). The overall response rate (ORR)
164 was defined as the proportion of patients for whom the best overall confirmed response was
165 stringent complete response (sCR), complete response (CR), very good partial response

166 (VGPR), or partial response (PR). Post-hoc analyses were performed to examine associations
167 between progression-free survival (PFS) and chromosome 17 deletion status and/or *TP53*
168 gene mutation status. Furthermore, another post-hoc analysis was carried out to study the
169 patient responder status in the chromosome 17 deletion population.

170

171 **Assessment of *TP53* mutation status of OCEAN trial patients**

172 *TP53* mutation status of OCEAN trial patients was determined by next generation sequencing
173 (NGS) using Almac Genomic Services. In brief, Almac's NGS v2 *TP53* Assay has been
174 performed what detects germline and somatic single nucleotide variants (SNV), small insertion
175 and small deletion events within the promoter region, the coding and non-coding regions of
176 exons one to ten, a portion of exon eleven, and the intron-exon boundaries of *TP53* isoform a
177 (NM_000546) using the Illumina MiSeq platform. Sample preparation for the sequencing has
178 been performed as followed; from patients, whom consented, bone marrow aspirates CD138+
179 purified plasma cells had been frozen shipped to Almac Genomic Services. From CD138+
180 cells, DNA was extracted using QIAamp® DNA Blood Midi Kit (QIAGEN©), DNA quality was
181 checked according to Almac's Qubit quality control. NGS v2 *TP53* assay was performed using
182 the TruSeq Custom Amplicon Kit Dx and custom *TP53* oligo panel. Analysis was performed
183 as follows: sequencing, demultiplexing, FASTQ file generation, sequence alignment and
184 variant calling was automatically performed onboard the MiSeq system. Sequencing run,
185 sample and control QC was performed using the Almac Genomic Services developed
186 software, named Almac *TP53* CTA v2 Analysis. All detected SNVs were classified and aligned
187 with the National Library of Medicine, NIH database, for ClinVar genomic variation database
188 and clinical relevance to classify mutation type into benign or pathogenic.
