## **Supplementary Figures**

**Supplementary Figure 1** Schemata of location of analysed wastewater Collection Points (CP) on tertiary hospital site Hospital wastewater was sampled from indicated locations, which are the main clinical areas of the hospital site, over a 24-hour period using composite samplers. Shaded areas represent the drainage of the sampled manholes. CP4 was a manhole located underneath the hospital in a plant room.

Supplementary Figure 2 Antimicrobial consumption by class over different hospital departments

Pharmacy issues to the wards within the collection points were collated over a three -month period and defined daily dose (DDD) per 100 occupied bed days (OBD) calculated to represent the antimicrobial consumption at each collection point.

DDD= defined daily dose, OBD = occupied bed day, ITU=intensive care unit, SHDU = surgical high dependency unit.

**Supplementary Figure 3** Phenotypic resistance in clinical isolates by antimicrobial class represented by average antibiogram length per organism at each collection point

Supplementary Figure 4 Total AMR gene abundance in FPKM

Supplementary Figure 5 Procrustes analysis on ordinations of AMR genes and bacterial composition

Supplementary Figure 6 Fifteen most common AMR genes relative to total abundance within samples

Supplementary Figure 7 Antibiotic residues from composite hospital wastewater sample and urban sewage as measured by LC-MS/MS

## Supplementary tables

		Non-human						Unclassified
