eAppendix. Materials and Methods

Identification of statewide social distancing measures

Our strategy to identify all statewide social distancing measures involved the triangulation of data from state government and third-party sources. First, during March 25-31, 2020 we searched the web sites for all 50 U.S. state and commonwealth governments and the District of Columbia to identify all statewide social distancing measures implemented from January 21-March 31, 2020 to address the spread of coronavirus infection, including executive orders; legislation; state of emergency or public health emergency declarations; major disaster declarations; restrictions on travel or internal movement; limitations on mass gatherings; and closures of schools or workplaces. Our searches included the web sites for the respective state governments, state departments of education, state departments of public health, and any state-sponsored COVID-specific web sites.

To ensure the completeness of our search, we then cross-referenced our findings against several third-party sources:

- Al Jazeera Media Network. Lockdowns, closures: How is each U.S. state handling coronavirus? *Al Jazeera*. Available at: <https://www.aljazeera.com/news/2020/03/emergencies-closures-states-handling-coronavirus-200317213356419.html>. Last accessed March 31, 2020.
- The Council of State Governments. COVID-19 resources for state leaders. Available at: <https://web.csg.org/covid19/executive-orders/>. Last accessed March 31, 2020.
- Gershman D. A guide to state coronavirus lockdowns. *Wall Street Journal*. Available at: <https://www.wsj.com/articles/a-state-by-state-guide-to-coronavirus-lockdowns-11584749351>. Last accessed March 31, 2020.
- Mervosh S, Lu D, Swales V. See which states and cities have told residents to stay at home. *New York Times*. Available at: <https://www.nytimes.com/interactive/2020/us/coronavirus-stay-at-home-order.html>. Last accessed March 31, 2020.
- MultiState. COVID-19 policy tracker. Available at: <https://www.multistate.us/pages/covid-19-policy-tracker>. Last accessed March 31, 2020.

In the event we identified any discrepancies, official state government sources were assumed to have precedence.

To be included in our analysis, social distancing measures had to meet the following criteria:

1. The social distancing measure had to have been announced and implemented by March 31, 2020. For example, on March 30, the Mayor of Washington, D.C. issued a stay-at-home order that will go into effect on April 1. This order was not included in our analysis.
2. The social distancing measure had to be binding. For example, on March 15, the Governor of Iowa issued a statement recommending that all public schools close for four weeks beginning March 16. On March 17, the Governor then issued a State of Public Health Disaster Emergency that included, among other provisions, mandatory closures of bars, eateries, and other facilities. Thus, in our dataset the state of Iowa was coded as implementing its first statewide social distancing measure on March 17, and the recommendation on school closings was not included.
3. The social distancing measure had to be binding statewide. As another example, on March 13, the Jefferson County (Alabama) Board of Education issued a statement closing all public schools beginning March 16. On the same day, the Governor of Alabama issued a proclamation that public schools would be closed beginning March 18. Thus, in our dataset the state of Alabama was coded as implementing its first statewide social distancing measure on March 18.

We categorized social distancing measures using a previously published typology (1): closures of schools, closures of workplaces, cancellations of public events, restrictions on internal movement, and closures of state borders. The complete list of dates of implementation of statewide social distancing measures, by type of measure and by state, is shown in **eTable 1**. The timeline of implementation of these measures is shown in the **eFigure**.

Sensitivity analyses

In our analysis, we examined the effects of two types of statewide social distancing measures. First, we examined the effect of implementing any type of statewide social distancing measure. Second, we examined the effect of implementing a statewide restriction on internal movement, colloquially referred to as a “lockdown.”

To assess the robustness of our findings, we conducted several sensitivity analyses. First, to adjust for potential confounding by population density, we adjusted our estimates by state-level population density (2, 3). To account for weekly periodicity that could also coincide with implementation of social distancing measures, we also adjusted for day of the week (4, 5). In the analysis estimating the effect of the first statewide social distancing measure of any kind (second row, **eTable 2**) the magnitude of the estimated regression coefficient was reduced by approximately one-fourth but remained statistically significant, implying a reduction in the daily growth rate of 0.6% per day ($b=-0.006$; 95% CI, -0.012 to -0.00026). The estimated effect of statewide restrictions on internal movement was not statistically significant (second row, **eTable 3**).

Second, although implementation of social distancing measures is most likely to show population-level effectiveness in reducing coronavirus transmission after 3 days given its estimated incubation period (6), we refitted the regression models specifying longer incubation periods of 4 and 5 days. As can be observed in the third row of **eTable 2**, lengthening the incubation period to 4 days attenuated both the magnitude and statistical significance of the estimated regression coefficient on the primary variable of interest. In the analysis estimating the effect of the first statewide social distancing measure of any kind, lengthening the incubation period to 5 days further reduced the magnitude of the estimated regression coefficient such that it was no longer statistically significant (fourth row, **eTable 2**). Whether the incubation period was specified as 4 days or 5 days, the estimated effect of statewide restrictions on internal movement was not statistically significant (third and fourth rows, **eTable 3**).

Third, to assess the extent to which early vs. late implementation of social distancing measures modified the effects of these actions (7), we stratified our estimates by the size of the epidemic in the state. In the analysis estimating the effect of the first statewide social distancing measure of any kind, epidemic size was categorized into <100 versus ≥ 100 cases at the time the first statewide social distancing measure was implemented. In the analysis estimating the effect of statewide restrictions on movement, which were implemented a median of 10 days after the first social distancing measure, epidemic size was categorized into <500 versus ≥ 500 cases at the time the first statewide restriction on internal movement was implemented. As can be observed in the fifth and sixth rows of **eTable 2** and **eTable 3**, none of the stratified estimates were statistically significant, suggesting that implementation of social distancing measures was similarly effective in epidemics of smaller vs. larger size.

eTable 1. Dates of implementation of statewide social distancing measures, by type of measure and by state

Notes: A, closure of schools; B, closure of workplaces; C, cancellation of public events; D, restrictions on internal movement; E, closure of state borders

eTable 2. Sensitivity analyses for the effect of implementation of any statewide social distancing measure on daily epidemic growth rate

| Model | Estimated coefficient | 95% confidence interval | P-value |
|---|------------------------------|--------------------------------|----------------|
| Unadjusted estimate with 3-day incubation period | -0.008 | -0.014, -0.002 | 0.008 |
| Adjusted for population density and day of week | -0.006 | -0.012, -0.000 | 0.041 |
| Unadjusted estimate with 4-day incubation period | -0.006 | -0.012, -0.000 | 0.028 |
| Unadjusted estimate with 5-day incubation period | -0.005 | -0.011, -0.000 | 0.070 |
| Unadjusted estimate, among states with <100 cases at the time the first statewide social distancing measure was implemented | -0.001 | -0.011, 0.008 | 0.789 |
| Unadjusted estimate, among states with \geq 100 cases at the time the first statewide social distancing measure was implemented | 0.010 | -0.138, 0.157 | 0.900 |

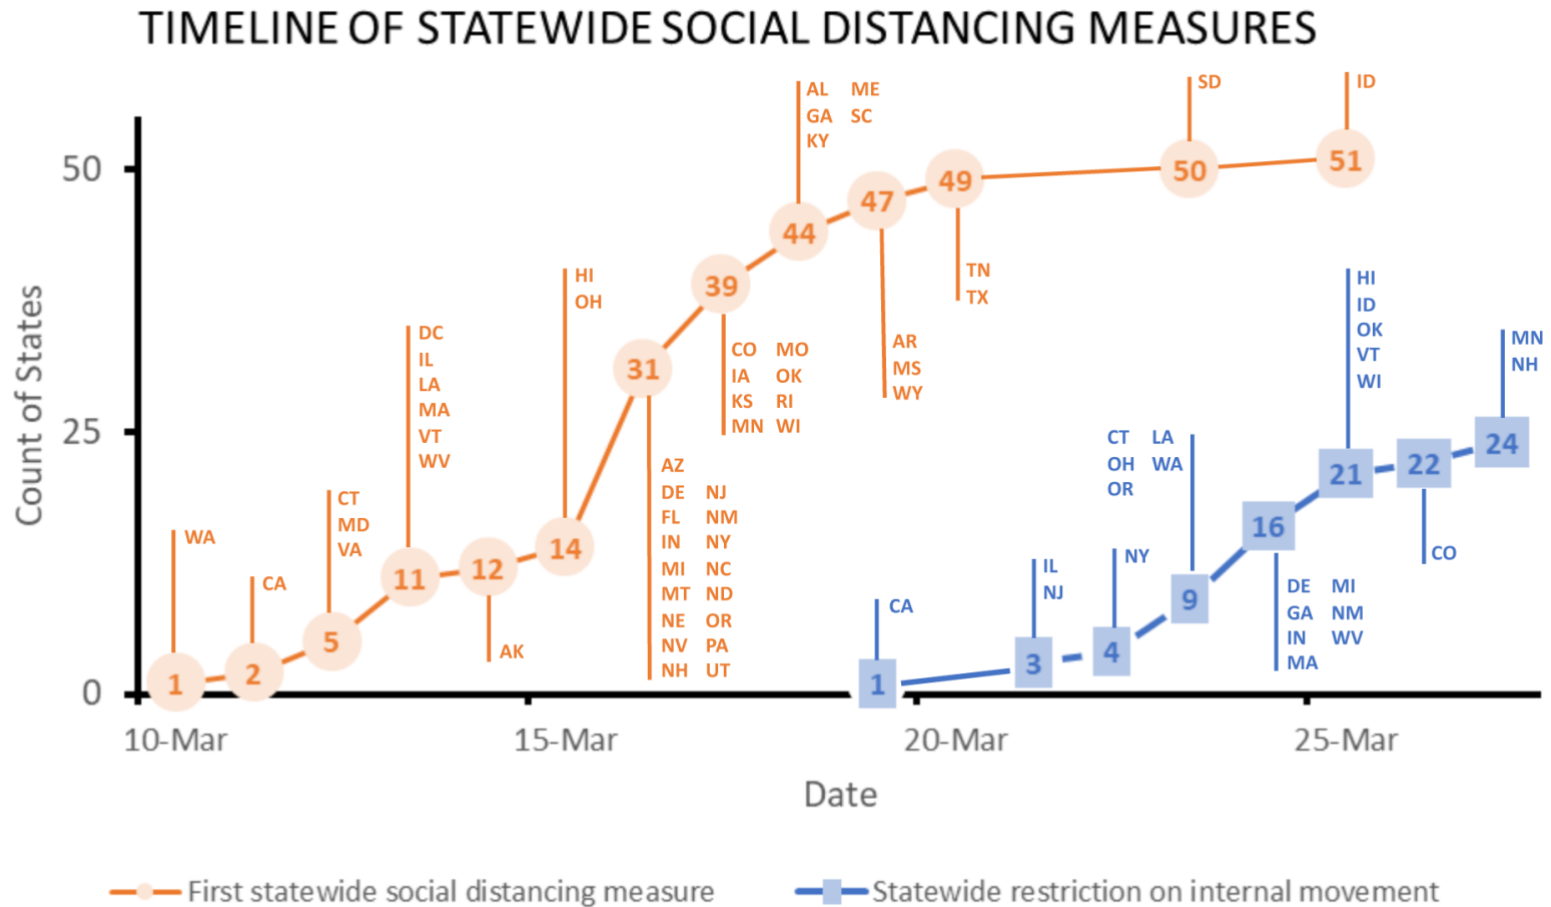

Notes: Each row corresponds to a separate regression model fitted to the data. The primary analysis is based on a regression model that specifies a 3-day incubation period and that includes 3 variables: time in days, implementation period, and a time-by-implementation period product term.

eTable 3. Sensitivity analyses for the effect of implementation of statewide restriction on internal movement on daily epidemic growth rate

| Model | Estimated coefficient | 95% confidence interval | P-value |
|--|------------------------------|--------------------------------|----------------|
| Unadjusted estimate with 3-day incubation period | 0.003 | -0.014, 0.020 | 0.72 |
| Adjusted for population density and day of week | 0.005 | -0.011, 0.023 | 0.51 |
| Unadjusted estimate with 4-day incubation period | 0.006 | -0.016, 0.029 | 0.59 |
| Unadjusted estimate with 5-day incubation period | 0.011 | -0.021, 0.042 | 0.51 |
| Unadjusted estimate, among states with <500 cases at the time the statewide restriction on internal movement was implemented | -0.002 | -0.011, 0.007 | 0.69 |
| Unadjusted estimate, among states with \geq 500 cases at the time the statewide restriction on internal movement was implemented | 0.010 | -0.029, 0.048 | 0.62 |

Notes: Each row corresponds to a separate regression model fitted to the data. The primary analysis is based on a regression model that specifies a 3-day incubation period and that includes 3 variables: time in days, implementation period, and a time-by-implementation period product term.

eFigure. Timeline of implementation of first statewide social distancing measures and statewide restrictions on internal movement
