2 **eMethods**

3 **Cleaning regimen of rooms**

4 Routine environmental cleaning of the rooms was carried out by a trained team of
5 housekeeping staff. High-touch surfaces (e.g. bed rail, cardiac table, switches) were cleaned
6 twice daily using 5000 parts per million (ppm) sodium dichloroisocyanurate (NaDCC),
7 reconstituted using Biospot[®] Effervescent Chlorine Tablets. The floor was cleaned daily
8 using 1000ppm NaDCC. All surface sampling was performed in the morning before the first
9 cleaning cycle for the day.

10 **Supplemental Figure 1: Single general ward airborne infection isolation room layout**
11 **showing environmental sites sampled (top) and configuration of air samplers (bottom).**

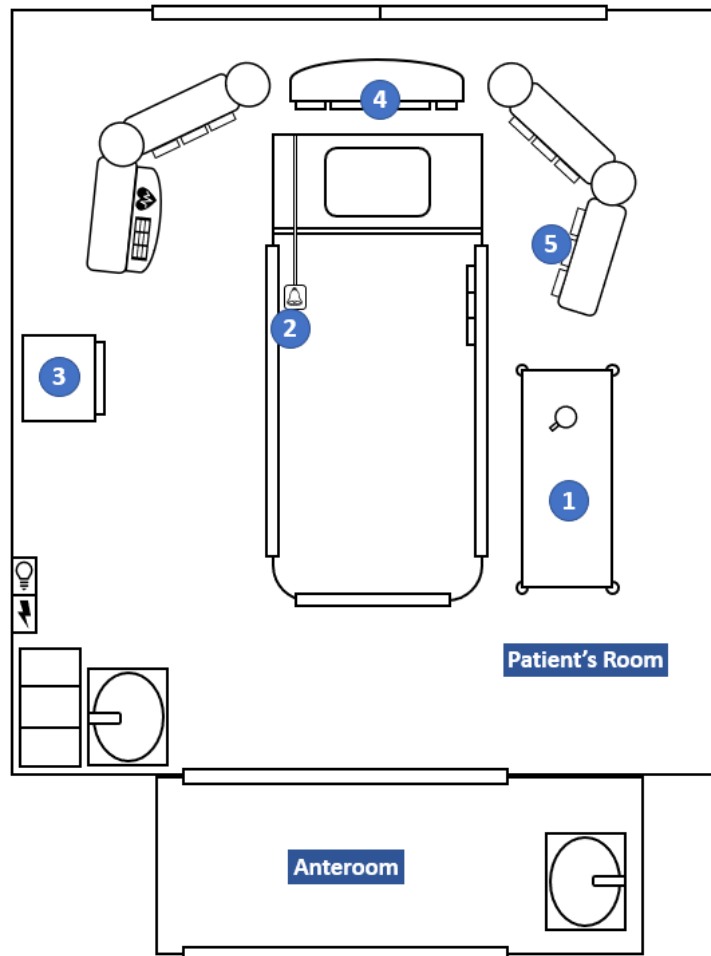

35 Top: Blue circles mark 5 high-touch areas: (1) cardiac table, (2) bed rail (including call bell),
36 (3) locker, (4) switches, and (5) chair; as well as other key sites sampled: (a) floor, (b) toilet
37 bowl seat. Red circles mark out positions of air samplers.

38 Bottom: Configuration of air samplers depicts air sampling layout in rooms 2 and 3 only.

42 Blue circles mark 5 high-touch areas: (1) cardiac table, (2) bed rail (including call bell), (3)
43 locker, (4) ventilator, and (5) surgical pendants.

68 * ICU rooms. All ICU patients had environmental swabs taken from the ventilator and infusion pumps instead of the electrical switches and toilet.

69 All samples from ICU were all negative.

Supplemental Table 2: All sites sampled, and the number of rooms sampled per site

Environmental Site	No. of rooms sampled
Patient room	
Cardiac table	30
Bed rail (including control panel and call bell)	30
Bedside locker	30
Floor	30
