

## Supplementary materials for

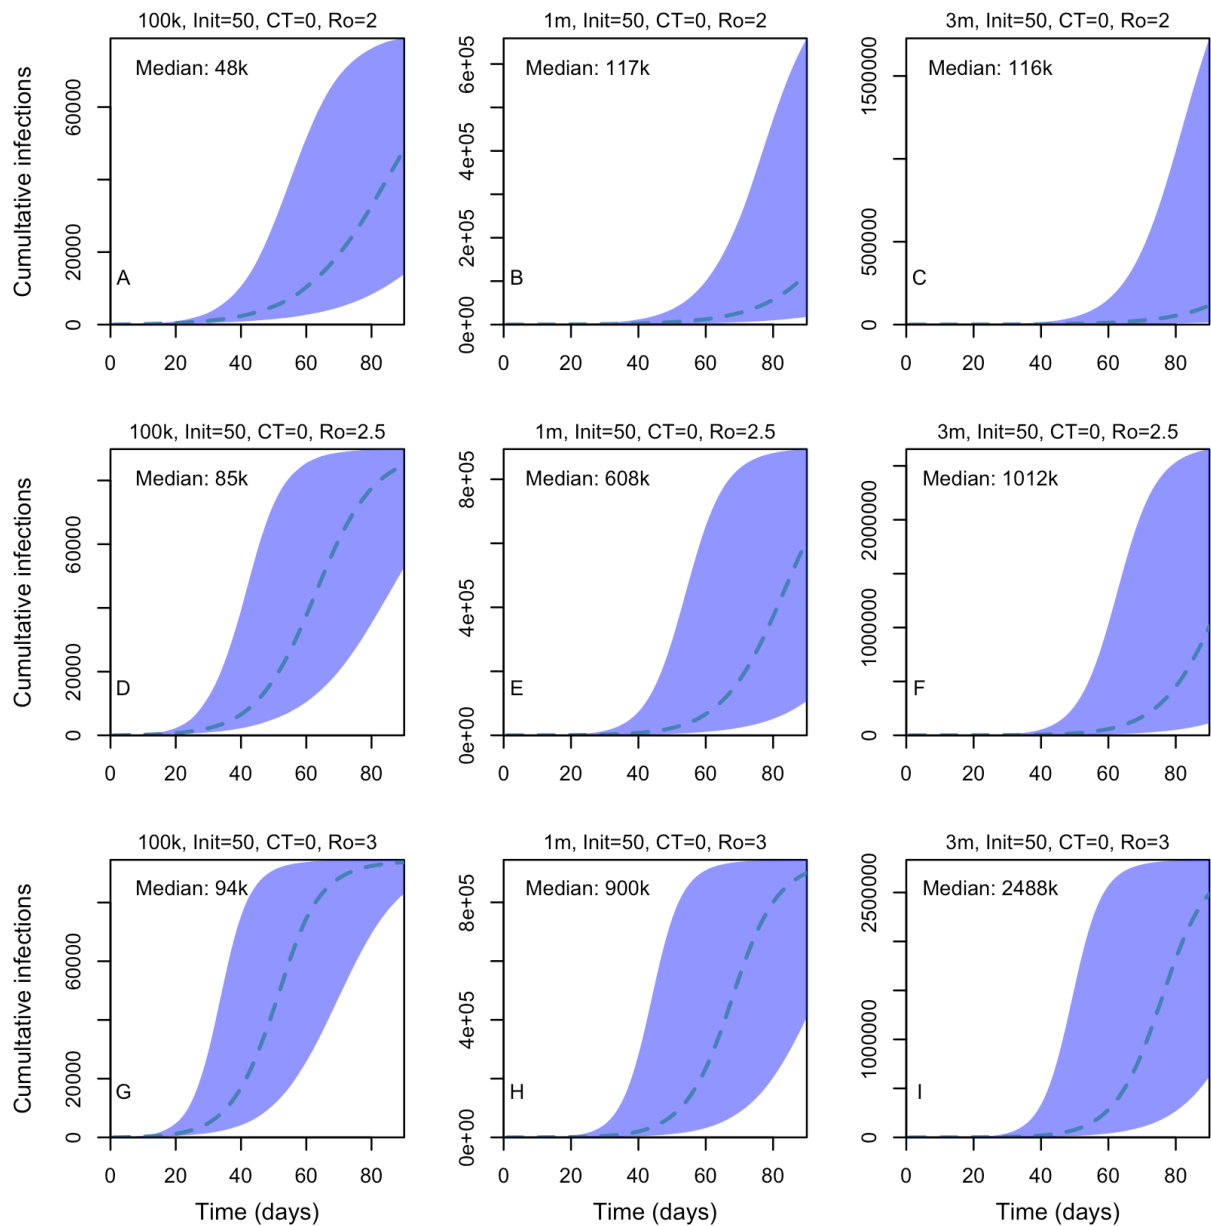

### Early estimates of COVID-19 infections in small, medium and large population clusters

**S1 Figure.** Cumulative number of infections in the initial 90 days with 50% contact tracing and 50 initial cases, assuming  $R_0=2$ , 2.5 and 3 (top to bottom respectively) for the three population sizes (left to right). Broken line shows the median value and blue region shows the 95% confidence interval.

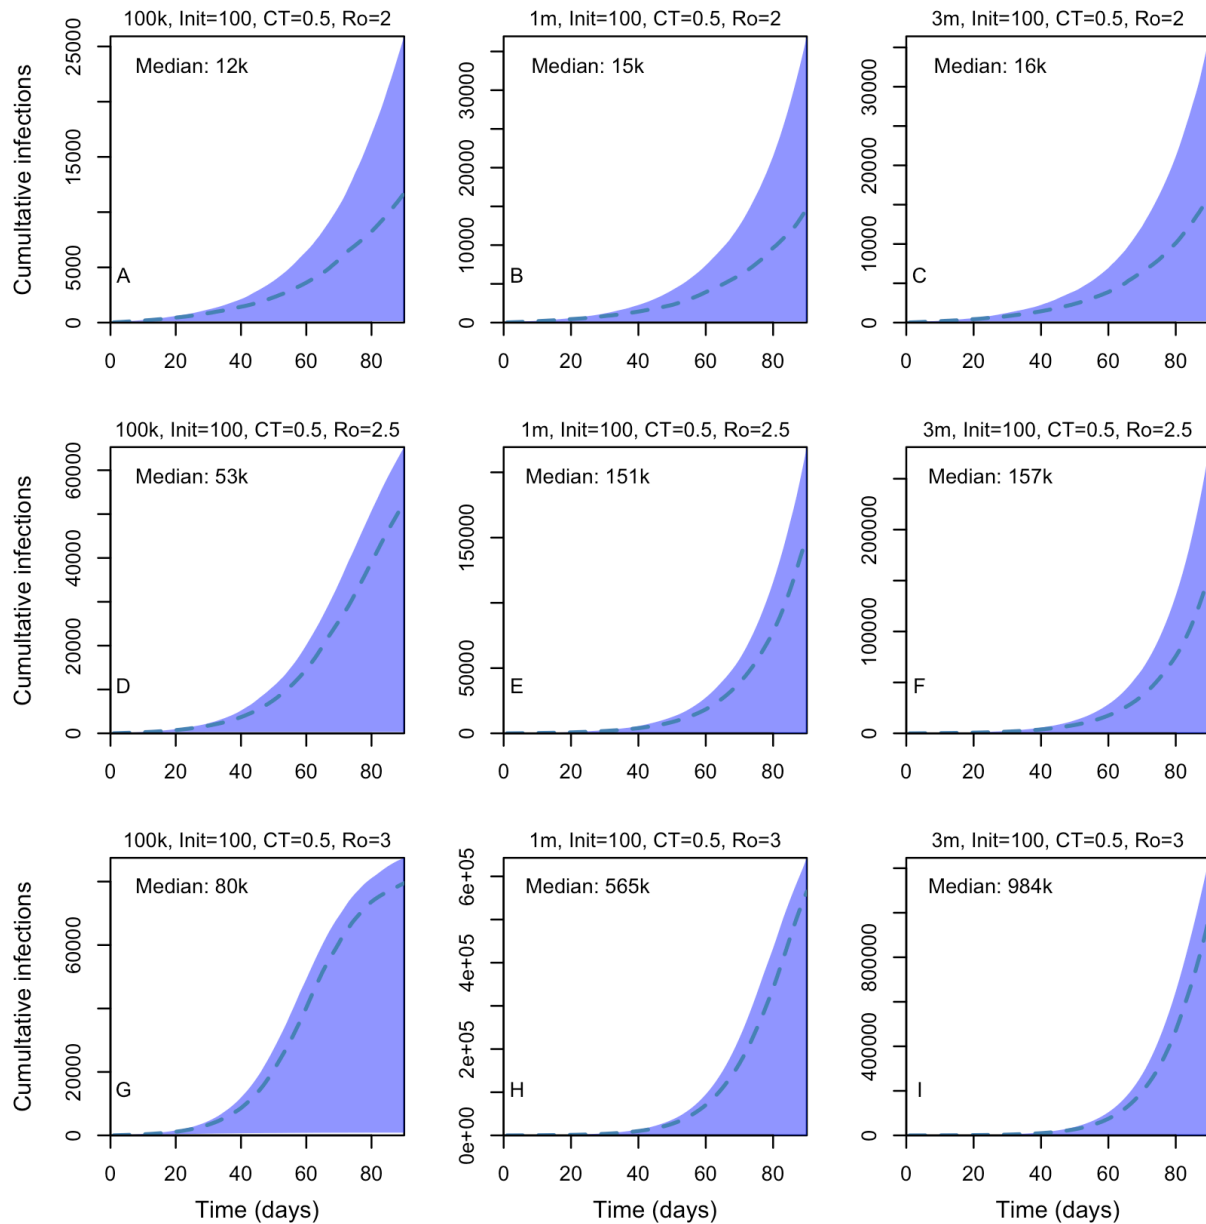

**S2 Figure.** Cumulative number of infections in the initial 90 days with 0% contact tracing and 50 initial cases, assuming  $R_0=2$ , 2.5 and 3 (top to bottom respectively) for the three population sizes (left to right). Broken line shows the median value and blue region shows the 95% confidence interval.

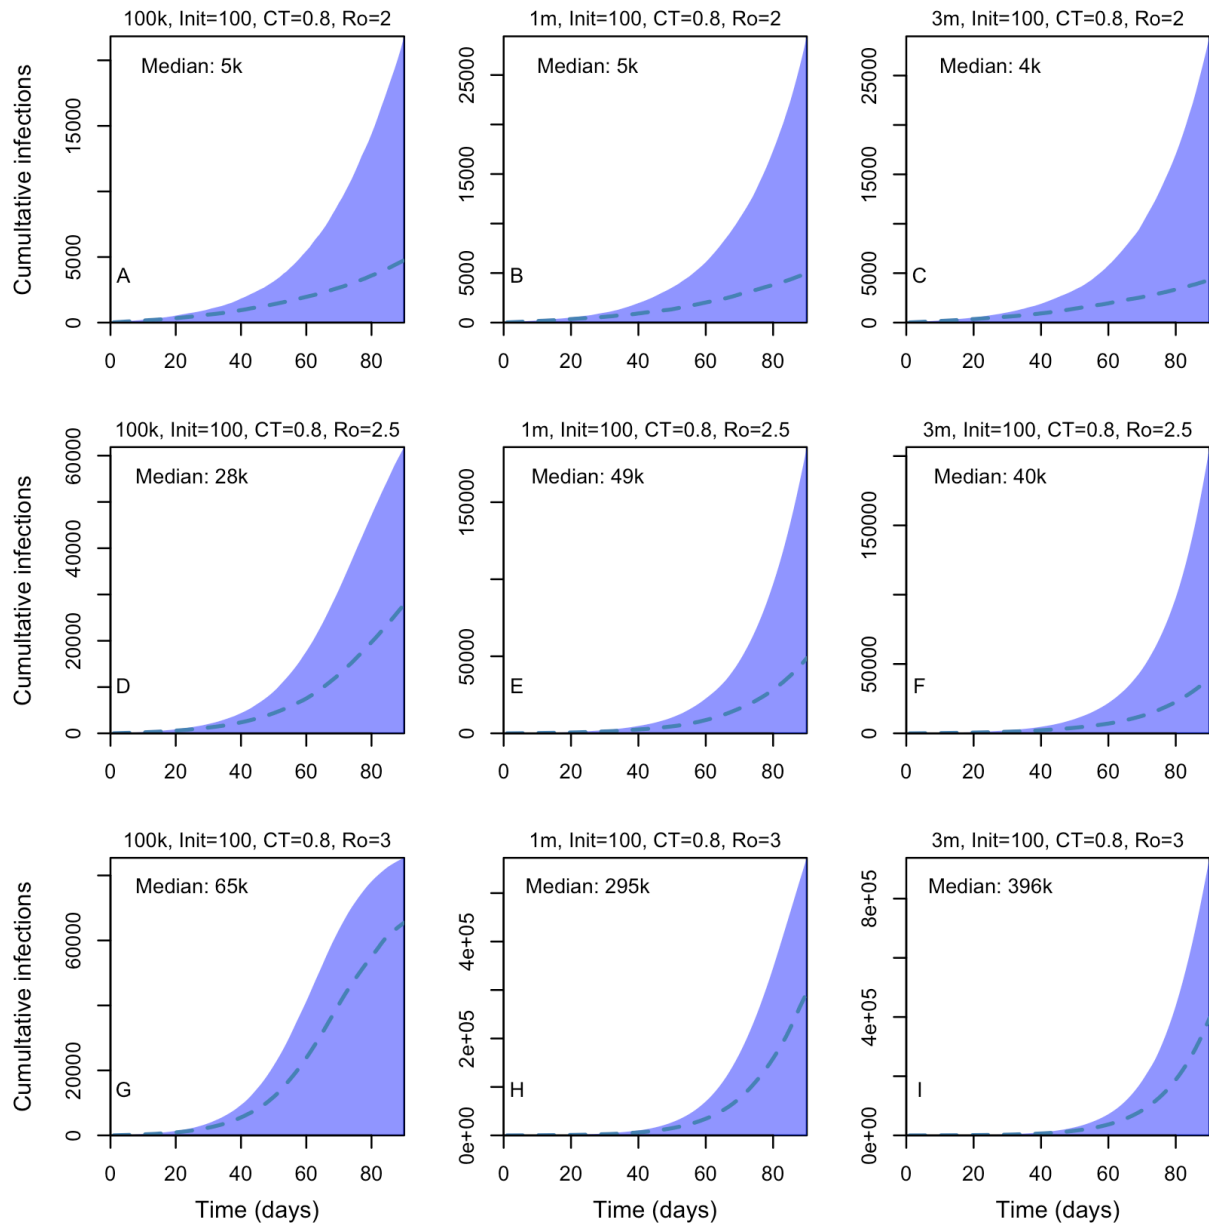

**S3 Figure.** Cumulative number of infections in the initial 90 days with 80% contact tracing and 50 initial cases, assuming  $R_0=2$ , 2.5 and 3 (top to bottom respectively) for the three population sizes (left to right). Broken line shows the median value and blue region shows the 95% confidence interval.

**S4 Figure.** Cumulative number of infections in the initial 90 days with 0% contact tracing and 100 initial cases, assuming  $R_0=2$ , 2.5 and 3 (top to bottom respectively) for the three population sizes (left to right). Broken line shows the median value and blue region shows the 95% confidence interval.

**S5 Figure.** Cumulative number of infections in the initial 90 days with 50% contact tracing and 100 initial cases, assuming  $R_0=2$ , 2.5 and 3 (top to bottom respectively) for the three population sizes (left to right). Broken line shows the median value and blue region shows the 95% confidence interval.

**S6 Figure.** Cumulative number of infections in the initial 90 days with 80% contact tracing and 100 initial cases, assuming  $R_0=2$ , 2.5 and 3 (top to bottom respectively) for the three population sizes (left to right). Broken line shows the median value and blue region shows the 95% confidence interval.

**S1 Table:** Estimated number of infections within the initial 90 days for the different scenarios considered

<i>Scenario</i>	<i>Cluster size (population)</i>	<i>Coverage of contact tracing</i>	<i>Basic reproduction number, <math>R_0</math></i>	<i>Initial number of cases</i>	<i>Estimates infections by day 90 (in '000) (95% CI)</i>
1	0.1	0	2	50	48.3 (13.9-79)
2	0.1	0	2	100	60 (24.3-79.5)
3	0.1	0	2.5	50	84.9 (52.7-89.9)
