eMethods 1. Study cohorts and data collection

The Finnish Public Sector study (FPS)

The prospective Finnish Public Sector cohort study comprises 260 240 public sector employees from 10 Finnish towns and 6 Finnish hospital districts identified from the employers' registers.⁵ 240 048 of them were available for this study and were linked to national registries of hospital discharge information (dates and diagnoses recorded by the National Institute for Health and Welfare) and medication reimbursement entitlements (dates and anatomical therapeutic chemical (ATC) codes recorded by the Finnish Social Insurance Institution) using the personal identification codes unique to each Finnish citizen. We also linked the participants to records on dates and causes of death from Statistics Finland. The ethics committee of Helsinki and Uusimaa Hospital District approved the register linkage and data analysis.

Diagnoses of hospital-treated infectious diseases (index infections)

We retrieved both primary and secondary diagnoses of hospital-treated diseases from inpatient hospital discharge information from 1 January 1980 to 31 December 2016, using the International Classification of Diseases, 10th Revision (ICD-10). The diagnosis codes from the 8th and 9th revisions (ICD-8 and ICD-9) were converted into the corresponding ICD-10 codes according to the national editions of the International Classification of Diseases (eTable 2 in this Supplement).²⁻⁴

Covariates

Participants' birthdate and sex were retrieved from the Finnish Population Information System. Information on the participants' education was available from Statistics Finland and analysed in three classes: low (basic education), intermediate (high school or vocational school), and high (university degree or other tertiary degree).

We defined comorbidities as follows: hypertension, ICD-10 codes I10–I15.9, ICD-8 and -9 codes 400–40499; diabetes mellitus, ICD-10 codes E10–E14.9, ICD-8 and -9 codes 250–25099; ischaemic heart disease, ICD-10 codes I20–I25.9, ICD-8 and -9 codes 410–41499; cerebrovascular disease, ICD-10 codes I60–I69.9, ICD-8 and -9 codes 430–43899; Parkinson's disease, ICD-10 code G20, ICD-8 and -9 codes 3320A and 34200. Additionally, we considered prescription medication reimbursement entitlements for the treatment of hypertension, diabetes mellitus, ischaemic heart disease, and Parkinson's disease (no reimbursement entitlements were granted for cerebrovascular disease during the study years). Data for hospitalisations were available from 1 January 1980 to 31 December 2016 and for medication reimbursement entitlements from 1964 to the end-of 2011 (diabetes), from 1970 to the end-of 2011 (hypertension), from 1986 to the end-of 2011 (ischaemic heart disease), and from 1966 to the end-of 2011 (Parkinson's disease).

A subsample of the study was invited to respond to mailed questionnaires (N = 114 835), and 92 727 of them responded to at least one questionnaire. Information on smoking status and alcohol drinking was retrieved from the earliest available self-report during the follow-up from June 1997 to November 2013 and was available for 90 305 participants on smoking and 90 740 participants on alcohol drinking. Smoking status was analysed in three categories (never smokers, ex-smokers, current smokers). The participants reported the number of different types of alcoholic drinks they consumed within a week. These reports were summed up to the total amount of alcoholic drinks consumed per week, with one drink estimated to contain approximately 10 grams of pure alcohol, and further categorized to four categories.⁶ The categories were non-drinkers, moderate drinkers (women consuming 1–14 drinks per week and men consuming 1–21 drinks per week), intermediate drinkers (women consuming 15–20 drinks per week and men consuming 22–27 drinks per week), and heavy drinkers (women consuming 21 drinks per week or more and men consuming 28 drinks per week or more).

Ascertainment of incident dementia

We compiled dementia diagnoses from hospital discharge information, reimbursed prescription medication purchases, and causes of death. Inpatient discharge information from hospitals and health center wards was available from 1 January 1980 to 31 December 2016, causes of death from 1 January 1980 to 31 December 2011, medication reimbursement entitlements for the treatment of dementia from February 1999 to 31 December 2011, and outpatient hospital visits (including outpatient clinic, emergency room, and day ward visits) from 1 January 2012 to 31 December 2016. The date of incident dementia was defined as the first occurrence of dementia diagnosis, whether primary or secondary, in any of these information sources.

Dementia follow-up

Follow-up for incident dementia started on study entry (the first day of the year in which the participant was first employed between 1990 and 2005) and continued until dementia diagnosis, death, or the end of follow-up (31 December 2016), whichever came first. However, to

avoid immortal time bias,⁷ we started the follow-up on the questionnaire date (or the latest questionnaire date if information on covariates was retrieved from more than one questionnaire) in the multivariate analyses (Table 2 in the main text) and in the analyses on conventional dementia risk factors (Figure 3 in the main text).

The Health and Social Support study (HeSSup)

The Health and Social Support study is a prospective cohort study representative of the Finnish population.⁸ A random sample from the Finnish Population Information System, stratified by sex and age group (20–24, 30–34, 40–44, and 50–54 years), was invited to respond a mailed questionnaire in 1998 (N = 64 797). This study comprises 24 057 respondents who returned the questionnaire and provided informed consent for register linkage. They were linked to national registries of hospital discharge information (dates and diagnoses recorded by the National Institute for Health and Welfare) and medication reimbursement entitlements (dates and anatomical therapeutic chemical (ATC) codes recorded by the Finnish Social Insurance Institution) using the personal identification codes unique to each Finnish citizen. The participants were also linked to records on dates and causes of death from Statistics Finland. The Turku University Central Hospital Ethics Committee approved the study.

Diagnoses of hospital-treated diseases (index diseases)

We retrieved both primary and secondary diagnoses of hospital-treated diseases from inpatient hospital discharge information available from 1 January 1998 to 31 December 2012 (with occasional information available from 4 August 1997 to 31 December 1997). We used the International Classification of Diseases, 10th Revision (ICD-10). All available data were coded according to ICD-10.

Covariates

Participants' birth year and sex were retrieved from the Finnish Population Information System. Information on education, smoking status, and alcohol drinking was retrieved from self-reports. Education was analysed in three classes: low (basic education), intermediate (apprenticeship, vocational school, or college degree), and high (university or polytechnic degree). Smoking status was analysed in three categories (never smokers, ex-smokers, current smokers). The participants reported the number of different types of alcoholic drinks they consumed within a week. These reports were summed up to the total amount of alcoholic drinks consumed per week, with one drink estimated to contain approximately 10 grams of pure alcohol, and further categorized to four categories.⁶ The categories were non-drinkers, moderate drinkers (women consuming 1–14 drinks per week and men consuming 1–21 drinks per week), intermediate drinkers (women consuming 15–20 drinks per week and men consuming 22–27 drinks per week), and heavy drinkers (women consuming 21 drinks per week or more and men consuming 28 drinks per week or more).

We defined comorbidities as follows: hypertension, ICD-10 codes I10–I15.9, ICD-8 and -9 codes 400–40499; diabetes mellitus, ICD-10 codes E10–E14.9, ICD-8 and -9 codes 250–25099; ischaemic heart disease, ICD-10 codes I20–I25.9, ICD-8 and -9 codes 410–41499; cerebrovascular disease, ICD-10 codes I60–I69.9, ICD-8 and -9 codes 430–43899; Parkinson's disease, ICD-10 code G20, ICD-8 and -9 codes 3320A and 34200. Additionally, we considered prescription medication reimbursement entitlements for the treatment of hypertension, diabetes mellitus, ischaemic heart disease, and Parkinson's disease (no reimbursement entitlements were granted for cerebrovascular disease during the study years). Data for hospitalisations were available from 1 January 1998 to 31 December 2012 (with occasional information available from 4 August 1997 to 31 December 1997) and for medication reimbursement entitlements from 1964 to the end-of 2013 (diabetes) or from 1970 to the end-of 2013 (hypertension), from 1986 to the end-of 2013 (ischaemic heart disease), and from 1968 to the end-of 2013 (Parkinson's disease).

Ascertainment of incident dementia

We compiled dementia diagnoses from inpatient hospital discharge information, reimbursed prescription medication purchases, and causes of death. Inpatient discharge information from hospitals and health center wards was available from 1 January 1998 to 31 December 2012 (with occasional information available from 4 August 1997 to 31 December 1997), causes of death from cohort entry (1998) to 31 December 2013, and medication reimbursement entitlements for the treatment of dementia from February 1999 to 31 December 2013. The date of incident dementia was defined as the first occurrence of dementia diagnosis, whether primary or secondary, in any of these information sources.

Dementia follow-up

Follow-up for incident dementia started on study entry (1 January 1998) and continued until dementia diagnosis, death, or end of follow-up (31 December 2012), whichever came first.

The Still Working study (STW)

The Still Working study is an ongoing prospective cohort study.⁹ In 1986, all employees of Enso Gutzeit (a large forest industry company, which nowadays is part of Stora Enso) in Finland were invited to respond to a mailed questionnaire (N = 12 173). 9276 of them were available for this study and were linked to national registries of hospital discharge information (dates and diagnoses recorded by the National Institute for Health and Welfare) and medication reimbursement entitlements (dates and anatomical therapeutic chemical (ATC) codes recorded by the Finnish Social Insurance Institution) using the personal identification codes unique to each Finnish citizen. Participants were also linked to records on dates and causes of death from Statistics Finland. The ethics committee of the Finnish Institute of Occupational Health approved the study.

Diagnoses of hospital-treated diseases (index diseases)

We retrieved both primary and secondary diagnoses of hospital-treated diseases from inpatient hospital discharge information from 1971 to 31 December 2016, using the International Classification of Diseases, 10th Revision (ICD-10). The diagnosis codes from the 8th and 9th revisions (ICD-8 and ICD-9) were converted into the corresponding ICD-10 codes according to the national editions of the International Classification of Diseases (eTable 1 in this Supplement).²⁻⁴

Covariates

Participants' birth year and sex were retrieved from the Finnish Population Information System. Information on occupational grade, smoking status, and alcohol drinking was retrieved from self-reports. Occupational grade was analysed in three categories (low, intermediate, high). Smoking status was analysed in three categories (never smokers, ex-smokers, current smokers). The participants reported the number of different types of alcoholic drinks they consumed within a week. These reports were summed up to the total amount of alcoholic drinks consumed per week, with one drink estimated to contain approximately 10 grams of pure alcohol, and further categorized to four categories.⁶ The categories were non-drinkers, moderate drinkers (women consuming 1–14 drinks per week and men consuming 1–21 drinks per week), intermediate drinkers (women consuming 15–20 drinks per week and men consuming 22–27 drinks per week), and heavy drinkers (women consuming 21 drinks per week or more and men consuming 28 drinks per week or more).

We defined comorbidities as follows: hypertension, ICD-10 codes I10–I15.9, ICD-8 and -9 codes 400–40499; diabetes mellitus, ICD-10 codes E10–E14.9, ICD-8 and -9 codes 250–25099; ischaemic heart disease, ICD-10 codes I20–I25.9, ICD-8 and -9 codes 410–41499; cerebrovascular disease, ICD-10 codes I60–I69.9, ICD-8 and -9 codes 430–43899; Parkinson's disease, ICD-10 code G20, ICD-8 and -9 codes 3320A and 34200. Additionally, we considered prescription medication reimbursement entitlements for the treatment of hypertension, diabetes mellitus, ischaemic heart disease, and Parkinson's disease (no reimbursement entitlements were granted for cerebrovascular disease during the study years). Data for hospitalisations were available from 1971 to 31 December 2016 and for medication reimbursement entitlements from 1964 to the end-of 2016 (diabetes) or from 1970 to the end-of 2016 (hypertension), from 1985 to the end-of 2016 (ischaemic heart disease), and from 1991 to the end-of 2016 (Parkinson's disease).

Ascertainment of incident dementia

We compiled dementia diagnoses from hospital discharge information, reimbursed prescription medication purchases, and causes of death. Inpatient discharge information from hospitals and health center wards was available from 1971 to 31 December 2016, causes of death from study entry (in 1 March 1986) to 31 December 2016, medication reimbursement entitlements for the treatment of dementia from February 1999 to 31 December 2016, and outpatient hospital visits (including outpatient clinic, emergency room, and day ward visits) from 1 January 2012 to 31 December 2016. The date of incident dementia was defined as the first occurrence of dementia diagnosis, whether primary or secondary, in any of these information sources.

Dementia follow-up

Follow-up for incident dementia started on study entry (1 March 1986) and continued until dementia diagnosis, death, or end of follow-up (31 December 2016), whichever came first.

The UK Biobank

The UK Biobank is an ongoing prospective cohort study (<https://www.ukbiobank.ac.uk/>). In 2006–2010, 500 000 participants aged 40–69 years were recruited from the United Kingdom. The data collection has involved measures, blood, urine and saliva samples, and questionnaires. The participants have agreed to have their health followed. The UK Biobank study has been approved by the North West

Multi-centre Research Ethics Committee (MREC). It has also been approved by the Patient Information Advisory Group (PIAG) in England and Wales and the Community Health Index Advisory Group (CHIAG) in Scotland.

Diagnoses of hospital-treated diseases (index diseases)

We retrieved both primary and secondary diagnoses of hospital-treated diseases from linked hospital admission data from HES APC (Hospital Episode Statistics–Admitted Patient Care [England]), SMR01 (Scottish Morbidity Records–General/Acute Inpatient and Day Case Admissions [Scotland]) and PEDW (Patient Episode Database for Wales), using the International Classification of Diseases, 10th Revision (ICD-10).

Covariates

Covariates included participants' birth year and sex, education, smoking status, alcohol drinking, and body mass index. Body mass index was measured at baseline and the other covariates were based on self-reports. Education was analysed in three categories (low, intermediate, high). Smoking status was also analysed in three categories (never smokers, ex-smokers, current smokers). Alcohol consumption was self-reported using the question "About how often do you drink alcohol?", and the categories for alcohol drinking were non-drinkers, moderate drinkers (one to three times a month or once or twice a week), intermediate drinkers (three or four times a week), and heavy drinkers (daily or almost daily).

Diabetes mellitus was defined by self-report or hospitalisation for it (ICD-10 codes E10–E14 and ICD-8 and -9 codes under 250 as primary or secondary diagnosis). Hypertension was defined by measurement at baseline (systolic blood pressure ≥ 140 mmHg) or hospitalisation for it (ICD-10 codes I10–I15 and ICD-8 and -9 codes 400–40499 as primary or secondary diagnosis). Ischaemic heart disease was defined by ICD-10 codes I20–I25.9 and ICD-8 and -9 codes 410–41499. Cerebrovascular disease was defined by ICD-10 codes I60–I69.9 and ICD-8 and -9 codes 430–43899. Parkinson's disease was defined by the UK Biobank algorithm (http://biobank.ndph.ox.ac.uk/showcase/showcase/docs/alg_outcome_pdp.pdf) that uses information from hospital records, death records, and self-reports.

Ascertainment of incident dementia

We defined all-cause dementia according to the UK Biobank algorithm (http://biobank.ndph.ox.ac.uk/showcase/showcase/docs/alg_outcome_dementia.pdf) that uses information from hospital records, death records, and self-reports. Alzheimer's disease, frontotemporal dementia, and vascular dementia were defined by the same algorithm. Other types of dementia were defined by ICD-codes from linked records. Additionally, those with algorithm defined all-cause dementia without a specific dementia diagnosis were considered to have unspecified dementia. The date of incident dementia was defined as the first occurrence of dementia diagnosis.

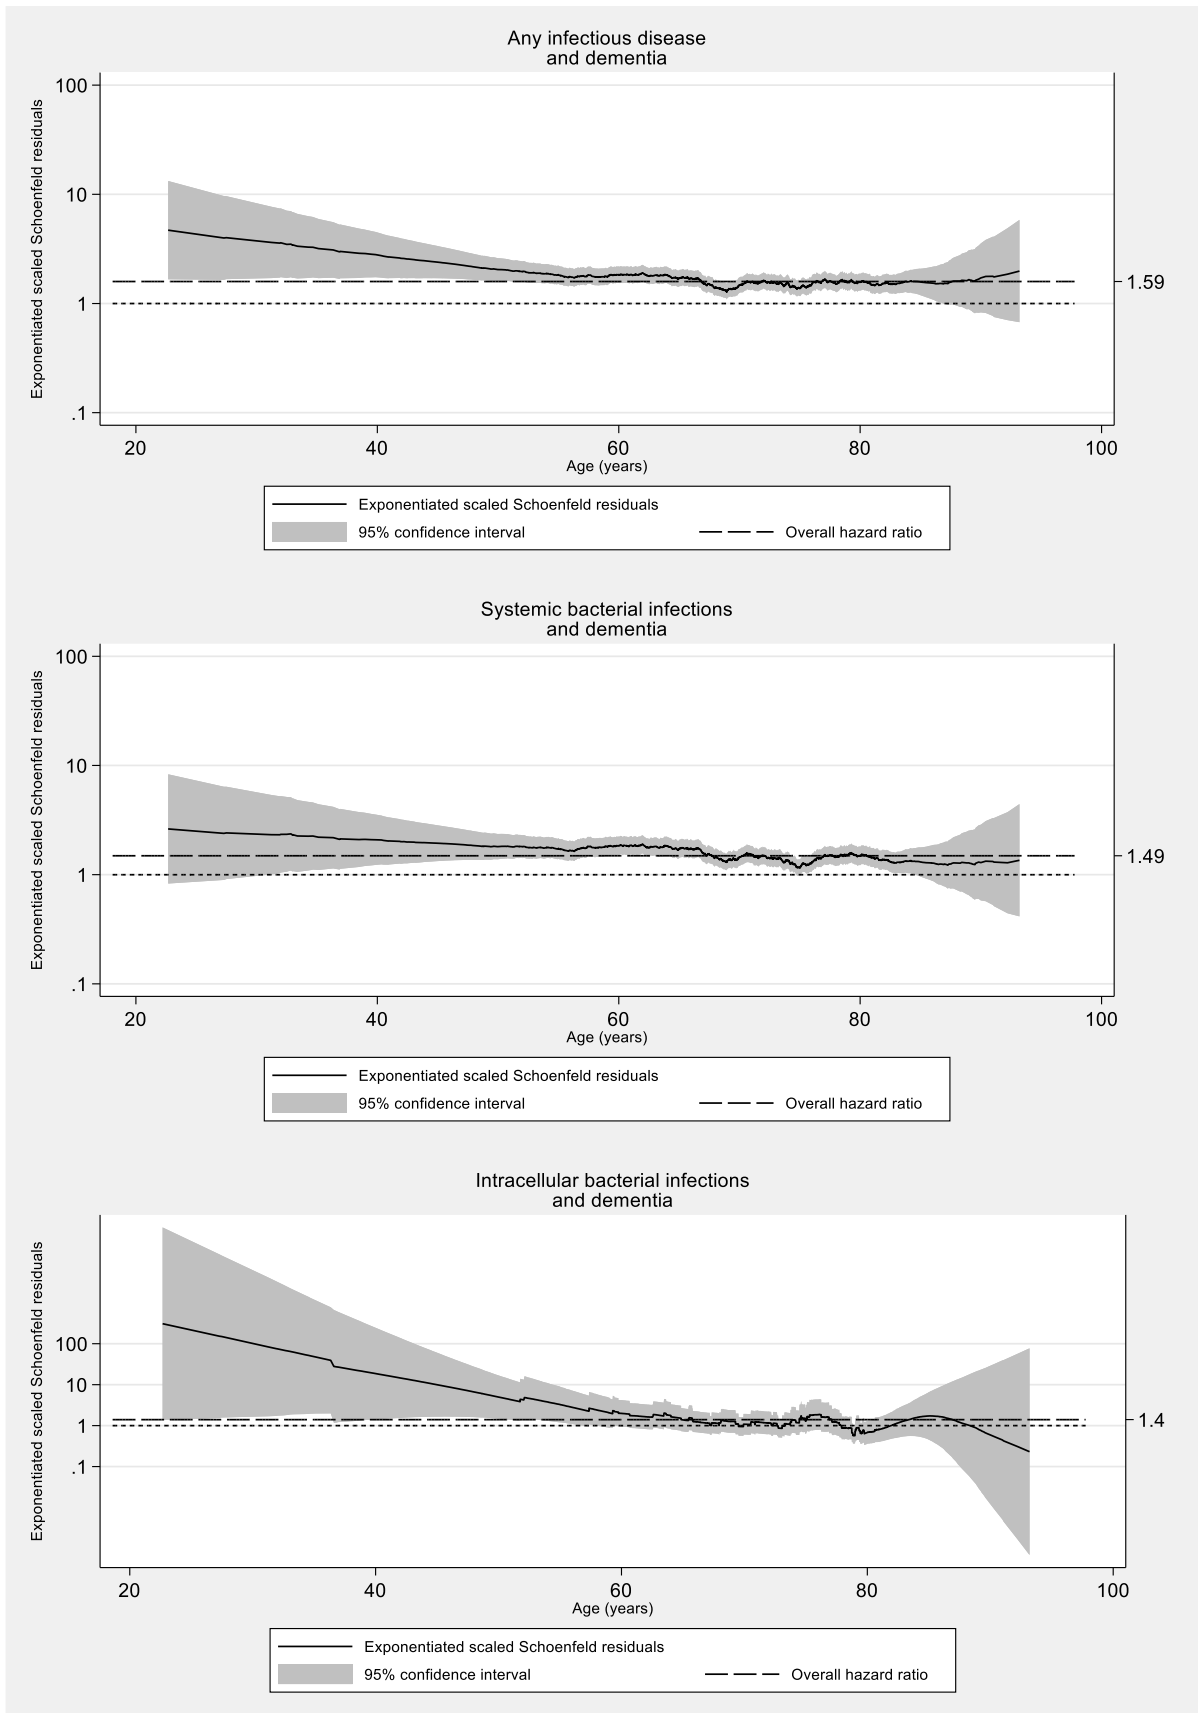

Dementia follow-up

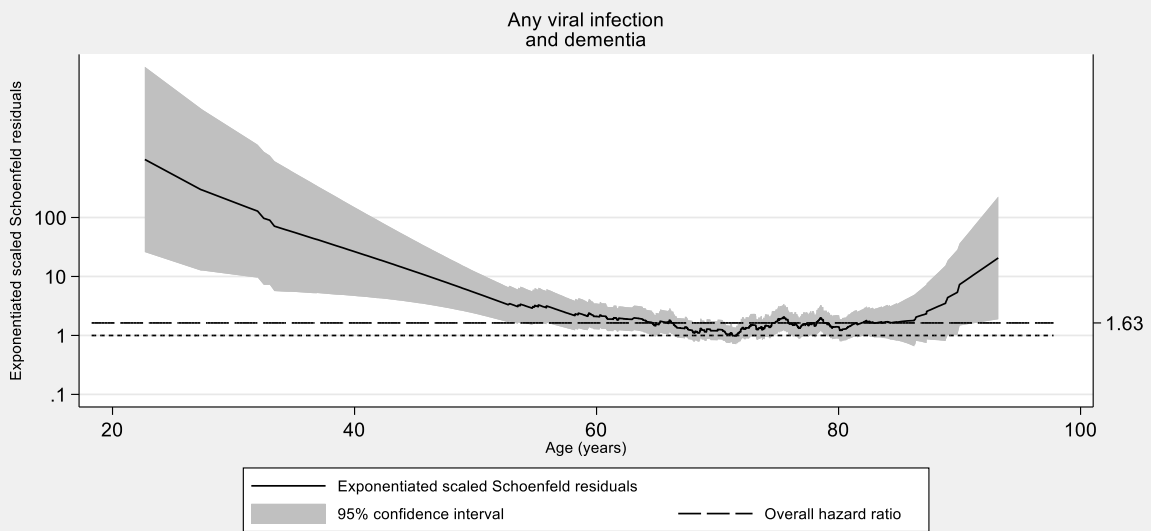

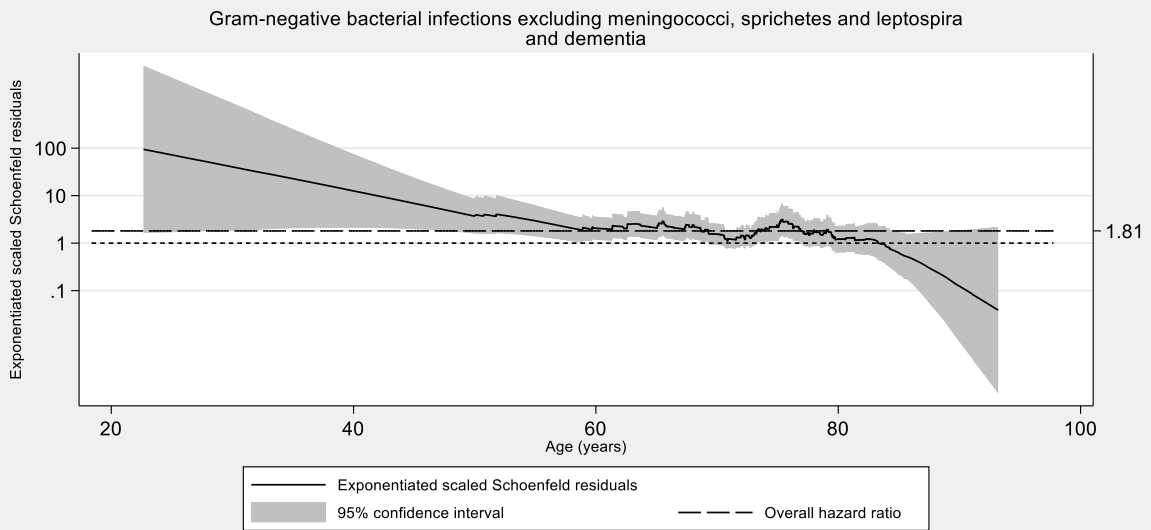

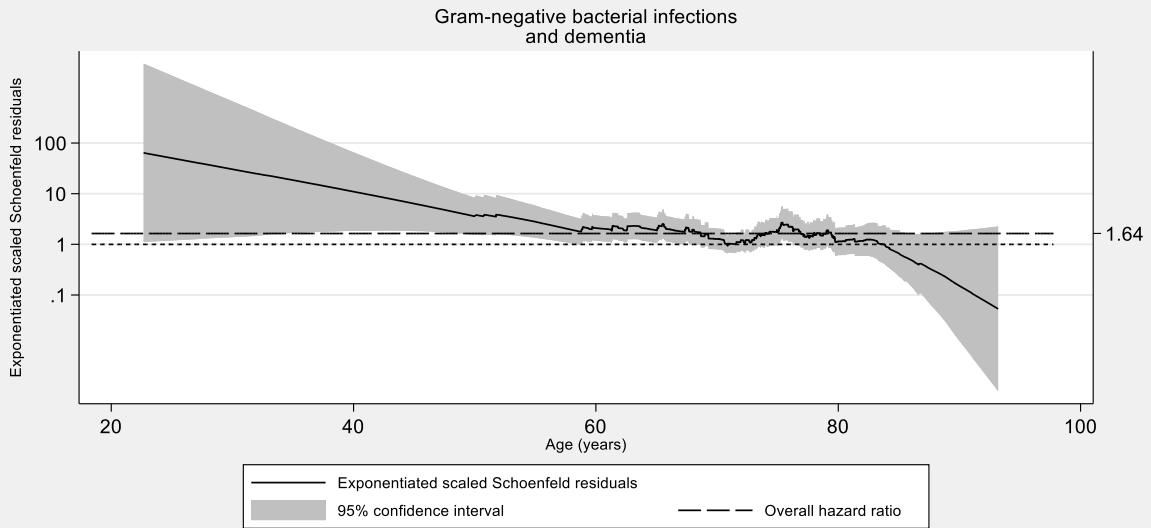

Follow-up for incident dementia started on study entry in 2006–2010 and continued until dementia diagnosis, death, or end of follow-up (7 February 2018), whichever came first.

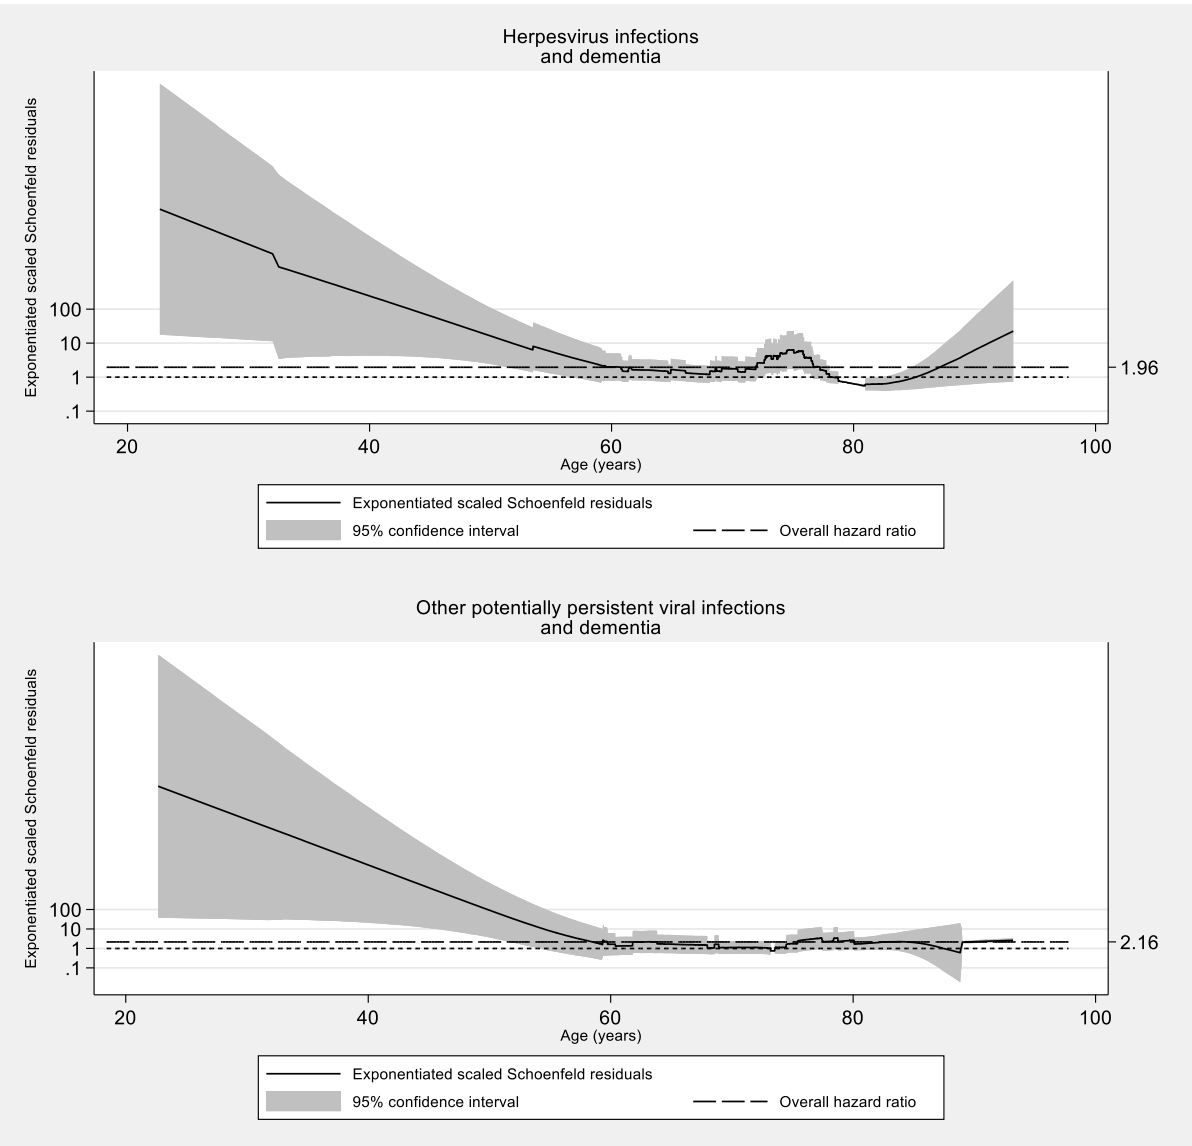

eMethods 2. Proportionality of hazards

We examined the proportional hazards assumption in the Cox models with scaled Schoenfeld residuals. These tests indicated a violation of the proportional hazards assumption for 8 classes of infectious diseases: any infectious disease, systemic bacterial infections, intracellular bacterial infections, Gram-negative bacterial infections, Gram-negative bacterial infections excluding those with known neurological sequelae, any viral infection, herpesvirus infections, and other potentially persistent viral infections. We assessed these diseases plotting exponentiated scaled Schoenfeld residuals using symmetric nearest neighbour smoothing (eFigure 2 on the next page of this Supplement).¹ The exponentiated scaled Schoenfeld residuals can be interpreted as hazard ratios and therefore visualize that the hazard ratios tended to diminish with increasing age.¹

eFigure 2. Visualisation of hazard ratios over time using exponentiated scaled Schoenfeld residuals

The plots are drawn using symmetric nearest-neighbor smoothing of the scaled Schoenfeld residuals, which can be interpreted as hazard ratios.¹

A05.1	Botulism	0051A	00510
A05.2	Foodborne Clostridium perfringens [Clostridium welchii] intoxication	0052A	
A05.3	Foodborne Vibrio parahaemolyticus intoxication	0054A	
A05.8	Other specified bacterial foodborne intoxications	0058X	00580
A05.9	Bacterial foodborne intoxication, unspecified		00597
A05.9	Bacterial foodborne intoxication, unspecified	0059X	00599
A05.9	Bacterial foodborne intoxication, unspecified	0053A	00520
A06	Amoebiasis	006	006
A07	Other protozoal intestinal diseases	007	007
A07.8	Other specified protozoal intestinal diseases	1365A	
A08.0	Rotaviral enteritis	0086A	
A08.1	Acute gastroenteropathy due to Norwalk agent	0086B	
A08.2	Adenoviral enteritis	0086C	
A08.3	Other viral enteritis		00880
A08.4	Viral intestinal infection, unspecified	0086X	00898

A08.5	Other specified intestinal infections	0088X	
A09	Other gastroenteritis and colitis of infectious and unspecified origin	009	009
A15.0	Tuberculosis of lung, confirmed by sputum microscopy with or without culture	0110A	
A15.0	Tuberculosis of lung, confirmed by sputum microscopy with or without culture	0112A	
A15.0	Tuberculosis of lung, confirmed by sputum microscopy with or without culture	0113A	
A15.0	Tuberculosis of lung, confirmed by sputum microscopy with or without culture	0116A	
A15.0	Tuberculosis of lung, confirmed by sputum microscopy with or without culture	0118A	
A15.0	Tuberculosis of lung, confirmed by sputum microscopy with or without culture	0119A	
A15.2	Tuberculosis of lung, confirmed histologically	0110B	
A15.2	Tuberculosis of lung, confirmed histologically	0112B	
A15.2	Tuberculosis of lung, confirmed histologically	0113B	
A15.2	Tuberculosis of lung, confirmed histologically	0116B	
A15.2	Tuberculosis of lung, confirmed histologically	0118B	
A15.2	Tuberculosis of lung, confirmed histologically	0119B	
A15.4	Tuberculosis of intrathoracic lymph nodes, confirmed bacteriologically and histologically	0121A	
A15.4	Tuberculosis of intrathoracic lymph nodes, confirmed bacteriologically and histologically	0121B	
A15.5	Tuberculosis of larynx, trachea and bronchus, confirmed bacteriologically and histologically	0122A	
A15.5	Tuberculosis of larynx, trachea and bronchus, confirmed bacteriologically and histologically	0122B	
A15.5	Tuberculosis of larynx, trachea and bronchus, confirmed bacteriologically and histologically	0123A	
A15.5	Tuberculosis of larynx, trachea and bronchus, confirmed bacteriologically and histologically	0123B	
A15.6	Tuberculous pleurisy, confirmed bacteriologically and histologically	0120A	
A15.6	Tuberculous pleurisy, confirmed bacteriologically and histologically	0120B	
A15.7	Primary respiratory tuberculosis, confirmed bacteriologically and histologically	0101A	
A15.7	Primary respiratory tuberculosis, confirmed bacteriologically and histologically	0101B	
A15.8	Other respiratory tuberculosis, confirmed bacteriologically and histologically	0128A	
A15.8	Other respiratory tuberculosis, confirmed bacteriologically and histologically	0128B	
A16.2	Tuberculosis of lung, without mention of bacteriological or histological confirmation	0110X	01099
A16.2	Tuberculosis of lung, without mention of bacteriological or histological confirmation	0112X	01101
A16.2	Tuberculosis of lung, without mention of bacteriological or histological confirmation	0113X	01102
