

Supplementary Figure 6. High-risk patients had nasopharyngeal swab positive retests and were readmitted to the hospital. The X-axis represented the duration of time (days) from the initial discharge date to the first positive retest during strict post-discharge quarantine. The Y-axis shows the percentage of high-risk patients who were retested as positive and readmitted to the hospital within the specified duration after discharge following a negative test. Three thresholds for high-risk patients were applied, giving an overall sensitivity of 93%, 81%, and 68%, respectively.
