

Supplementary Figure 7. This scatterplot demonstrates the relationship between SARS-CoV-2 RNA cycle threshold (Ct) value and body temperature at admission for patients with (i.e. the case group defined by nasopharyngeal swab PCR positivity; solid circles) and without (i.e. the control group; open diamonds) recurrence of PCR positivity. The vertical dotted line represents the threshold of high body temperature ($> 37.2\text{ }^{\circ}\text{C}$).
