

Supplementary Figure 1. Effect size of DESeq and post COCONUT -voom transformed data correlate.

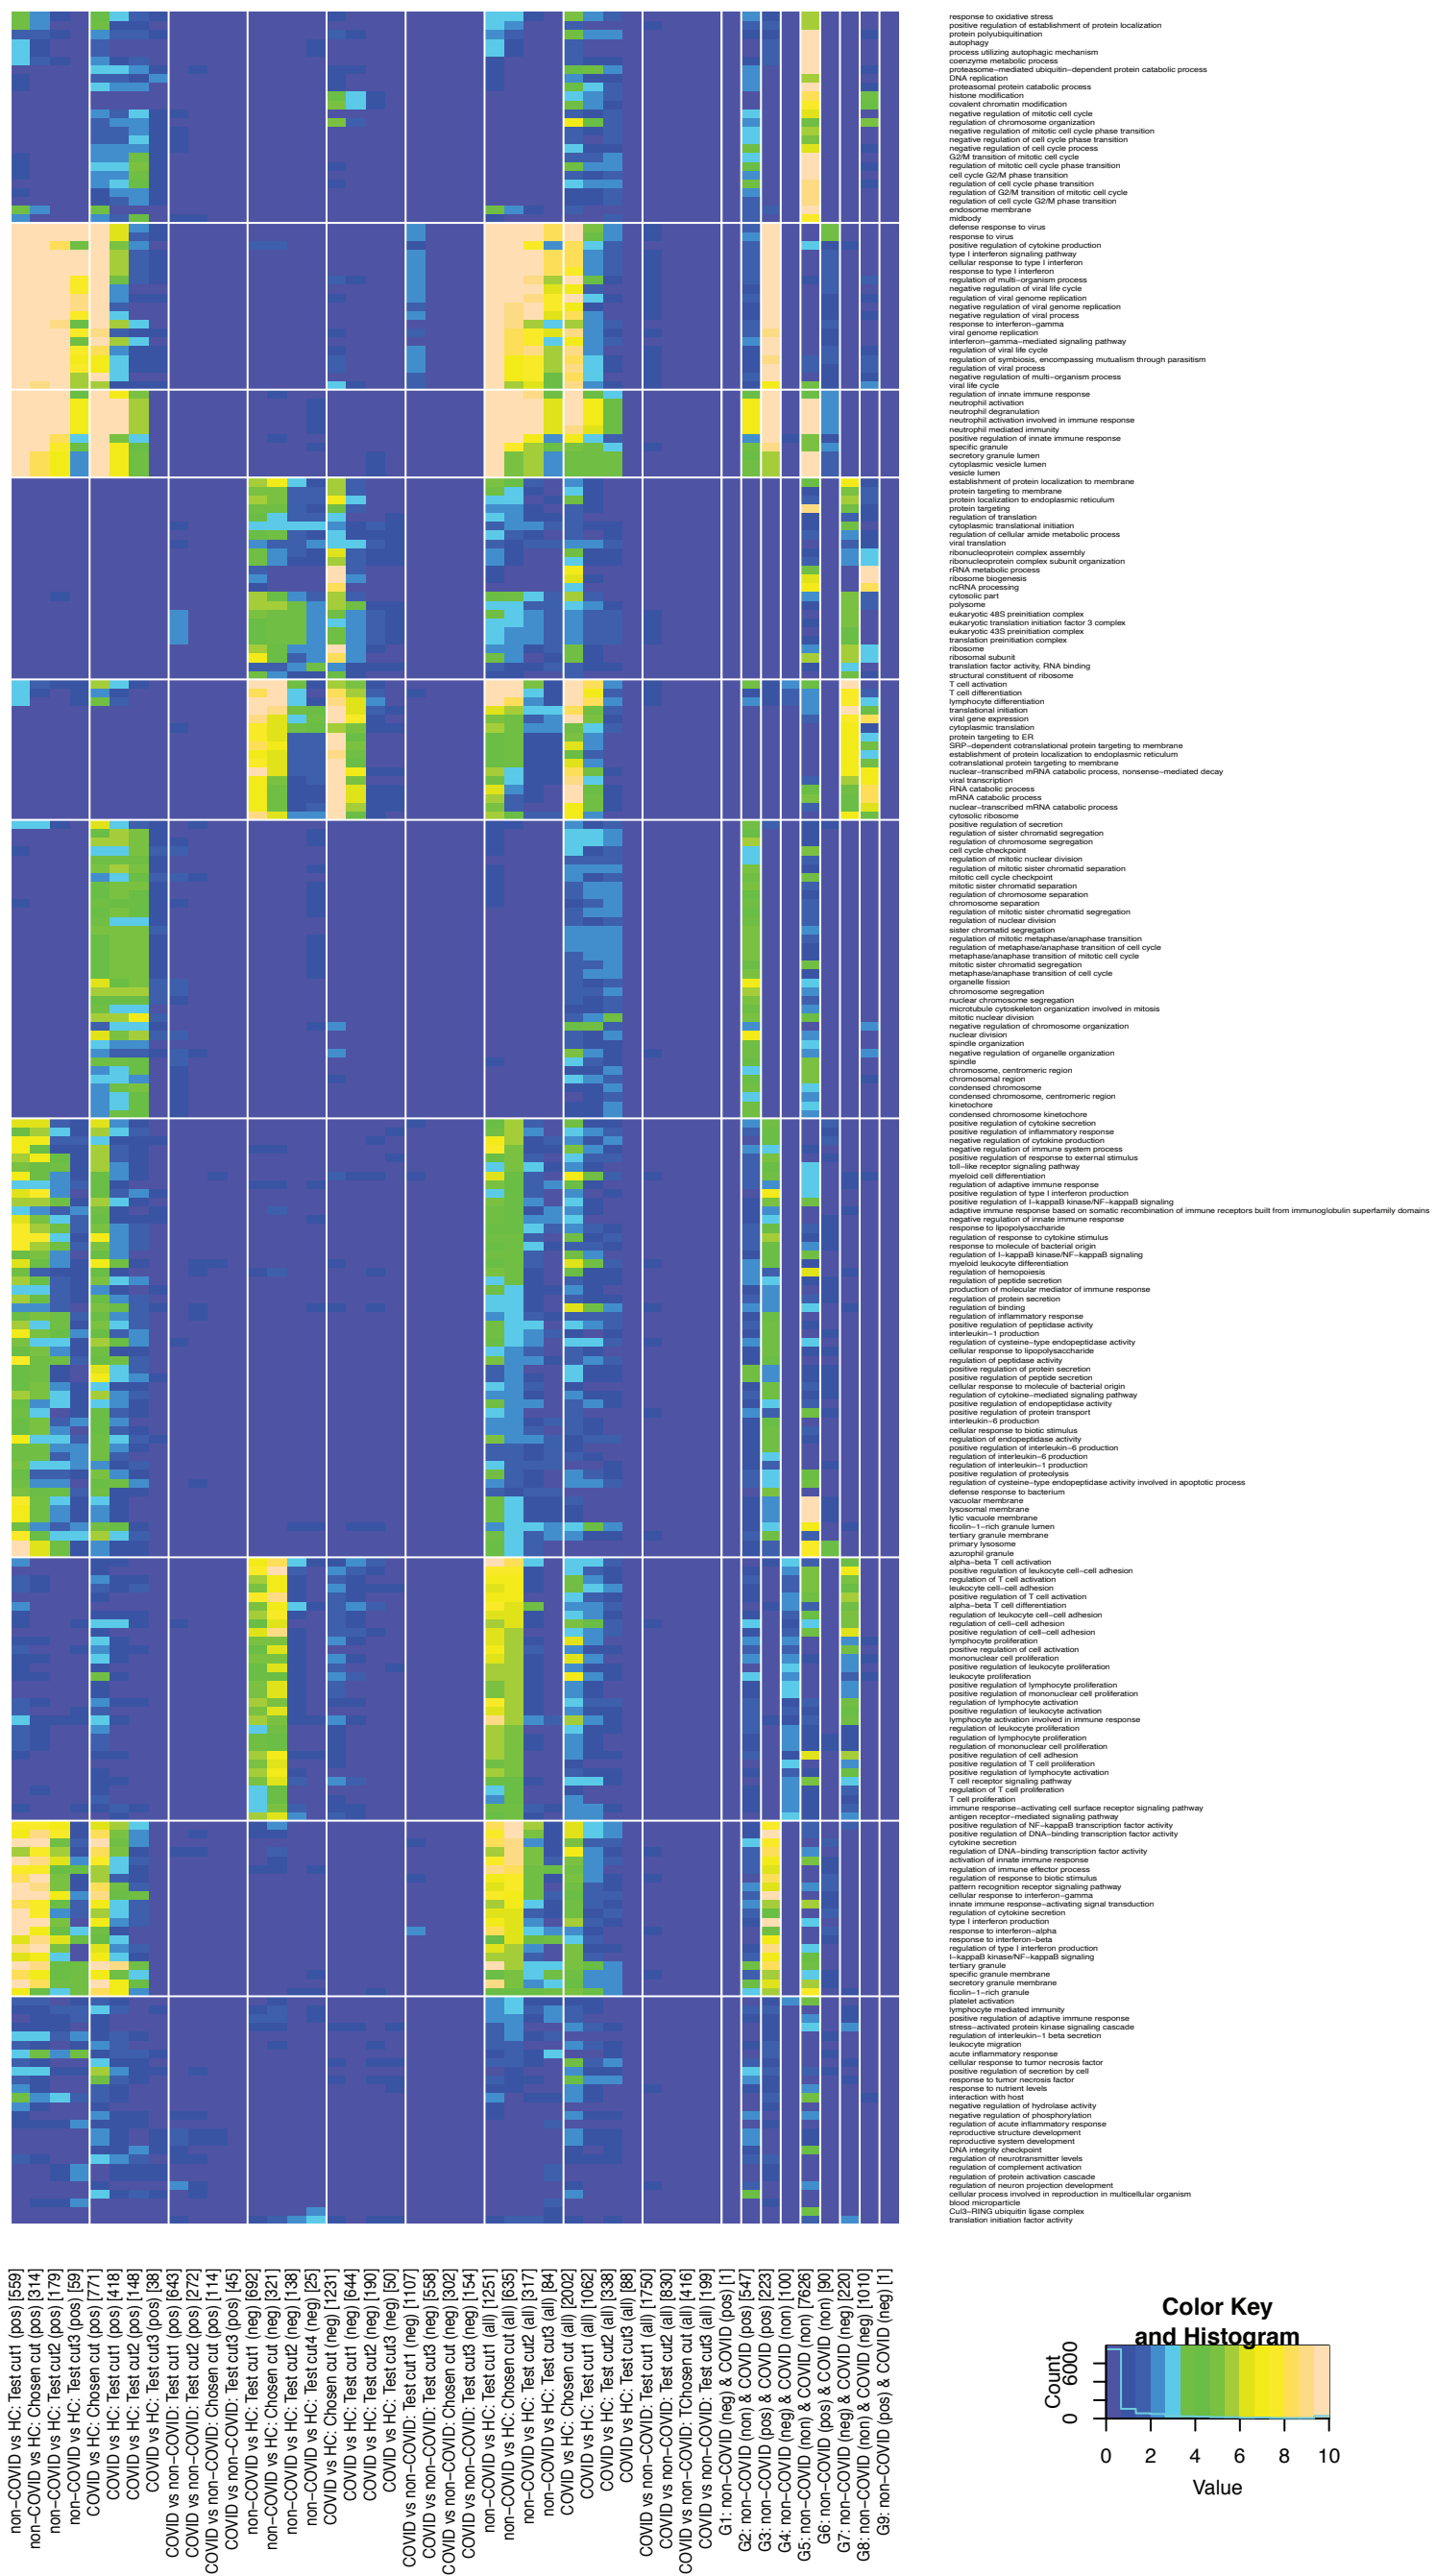

Power Analysis: Non-COVID Viral (652) vs Healthy (672)

Supplementary Figure 2. Power Analysis. non-COVID-19 (n=652) versus healthy controls (n=672).

Supplementary Figure 3. Forest plots of cell deconvolution estimates for all studies where estimation was possible.

Supplementary Figure 4. Heatmap of significance score defined as $-\log_{10}(P\text{-adjusted})$ from GO term enrichment analyses. Columns contain 45 gene sets including three gene sets (pos, neg, and all) each from COVID-19 vs HC, non-COVID-19 vs HC, or COVID-19 vs non-COVID-19 comparisons with the chosen cutoff and 3 more or less stringent cutoffs, together with 9 gene sets from Figure 4A (see Supplementary Table 4). Rows represent 252 GO terms filtered from a total 8422, in 10 groups by k-means.
